3.1 File List . . . . .	5
<b>4 Class Documentation</b>	<b>7</b>
4.1 App Class Reference . . . . .	7
4.1.1 Detailed Description . . . . .	7
4.1.2 Constructor & Destructor Documentation . . . . .	7
4.1.2.1 App() [1/2] . . . . .	8
4.1.2.2 App() [2/2] . . . . .	8
4.1.2.3 ~App() . . . . .	8
4.1.3 Member Function Documentation . . . . .	8
4.1.3.1 addHandler() . . . . .	8
4.1.3.2 addMiddleware() . . . . .	9
4.1.3.3 addPermanentlyRedirect() . . . . .	9
4.1.3.4 addRedirect() . . . . .	9
4.1.3.5 addTemporaryRedirect() . . . . .	10
4.1.3.6 init() . . . . .	10
4.1.3.7 run() . . . . .	10
4.2 Context Class Reference . . . . .	11

4.2.1 Detailed Description . . . . .	11
4.2.2 Constructor & Destructor Documentation . . . . .	11
4.2.2.1 Context() . . . . .	11
4.2.2.2 ~Context() . . . . .	12
4.2.3 Member Function Documentation . . . . .	12
4.2.3.1 emitCloseEvent() . . . . .	12
4.2.3.2 getDB() . . . . .	12
4.2.3.3 getMiddlewareByNameID() . . . . .	12
4.2.3.4 getRequest() . . . . .	13
4.2.3.5 getResponse() . . . . .	13
4.2.3.6 isClosed() . . . . .	13
4.2.3.7 setDB() . . . . .	13
4.2.3.8 setMiddlewareList() . . . . .	14
4.2.3.9 setPermanentlyRedirect() . . . . .	14
4.2.3.10 setRedirect() . . . . .	14
4.2.3.11 setRequest() . . . . .	14
4.2.3.12 setResponse() . . . . .	15
4.2.3.13 setTemporaryRedirect() . . . . .	15
4.3 CookieEntity Class Reference . . . . .	15
4.3.1 Detailed Description . . . . .	16
4.3.2 Constructor & Destructor Documentation . . . . .	16
4.3.2.1 CookieEntity() . . . . .	16
4.3.3 Member Function Documentation . . . . .	16
4.3.3.1 toString() . . . . .	16
4.4 CookieMiddleware Class Reference . . . . .	17
4.4.1 Detailed Description . . . . .	17
4.4.2 Constructor & Destructor Documentation . . . . .	17
4.4.2.1 CookieMiddleware() . . . . .	17
4.4.3 Member Function Documentation . . . . .	18
4.4.3.1 addCookie() . . . . .	18

4.4.3.2 autoExec()	18
4.4.3.3 exec()	18
4.4.3.4 insertInResponse()	19
4.5 DBManager Class Reference	19
4.5.1 Detailed Description	19
4.5.2 Constructor & Destructor Documentation	19
4.5.2.1 DBManager()	19
4.5.2.2 ~DBManager()	20
4.5.3 Member Function Documentation	20
4.5.3.1 execQuery()	20
4.6 DefaultResponse Class Reference	20
4.6.1 Detailed Description	21
4.6.2 Constructor & Destructor Documentation	21
4.6.2.1 DefaultResponse()	21
4.7 FileHandler Class Reference	21
4.7.1 Detailed Description	22
4.7.2 Constructor & Destructor Documentation	22
4.7.2.1 FileHandler()	22
4.7.3 Member Function Documentation	23
4.7.3.1 exec()	23
4.7.3.2 loadFile()	23
4.8 FormMiddleware Class Reference	23
4.8.1 Detailed Description	24
4.8.2 Constructor & Destructor Documentation	24
4.8.2.1 FormMiddleware()	24
4.8.3 Member Function Documentation	24
4.8.3.1 autoExec()	24
4.8.3.2 exec()	25
4.9 Handler Class Reference	25
4.9.1 Detailed Description	25

4.9.2 Constructor & Destructor Documentation . . . . .	25
4.9.2.1 Handler() . . . . .	25
4.9.2.2 ~Handler() . . . . .	26
4.9.3 Member Function Documentation . . . . .	26
4.9.3.1 exec() . . . . .	26
4.9.3.2 getContext() . . . . .	26
4.9.3.3 getMethod() . . . . .	27
4.9.3.4 getRoute() . . . . .	27
4.9.3.5 isRouted() . . . . .	27
4.9.3.6 setContext() . . . . .	27
4.10 HandlerApi Class Reference . . . . .	28
4.10.1 Constructor & Destructor Documentation . . . . .	28
4.10.1.1 HandlerApi() . . . . .	28
4.10.2 Member Function Documentation . . . . .	28
4.10.2.1 exec() . . . . .	28
4.11 HandlerCalculate Class Reference . . . . .	29
4.11.1 Constructor & Destructor Documentation . . . . .	29
4.11.1.1 HandlerCalculate() . . . . .	29
4.11.2 Member Function Documentation . . . . .	29
4.11.2.1 exec() . . . . .	29
4.12 HandlerCalculatePost Class Reference . . . . .	30
4.12.1 Constructor & Destructor Documentation . . . . .	30
4.12.1.1 HandlerCalculatePost() . . . . .	30
4.12.2 Member Function Documentation . . . . .	30
4.12.2.1 exec() . . . . .	30
4.13 HandlerCommon Class Reference . . . . .	31
4.13.1 Constructor & Destructor Documentation . . . . .	31
4.13.1.1 HandlerCommon() . . . . .	31
4.13.2 Member Function Documentation . . . . .	31
4.13.2.1 exec() . . . . .	31

4.14 HandlerCommonInfo Class Reference . . . . .	32
4.14.1 Constructor & Destructor Documentation . . . . .	32
4.14.1.1 HandlerCommonInfo() . . . . .	32
4.14.2 Member Function Documentation . . . . .	32
4.14.2.1 exec() . . . . .	32
4.14.2.2 getKey() . . . . .	33
4.15 HandlerCookie Class Reference . . . . .	33
4.15.1 Constructor & Destructor Documentation . . . . .	33
4.15.1.1 HandlerCookie() . . . . .	33
4.15.2 Member Function Documentation . . . . .	33
4.15.2.1 exec() . . . . .	33
4.16 HandlerEstimate Class Reference . . . . .	34
4.16.1 Constructor & Destructor Documentation . . . . .	34
4.16.1.1 HandlerEstimate() . . . . .	34
4.16.2 Member Function Documentation . . . . .	34
4.16.2.1 exec() . . . . .	34
4.17 HandlerEstimatePost Class Reference . . . . .	35
4.17.1 Constructor & Destructor Documentation . . . . .	35
4.17.1.1 HandlerEstimatePost() . . . . .	35
4.17.2 Member Function Documentation . . . . .	35
4.17.2.1 exec() . . . . .	35
4.18 HandlerFeedback Class Reference . . . . .	36
4.18.1 Constructor & Destructor Documentation . . . . .	36
4.18.1.1 HandlerFeedback() . . . . .	36
4.18.2 Member Function Documentation . . . . .	36
4.18.2.1 exec() . . . . .	36
4.19 HandlerFeedbackPost Class Reference . . . . .	37
4.19.1 Constructor & Destructor Documentation . . . . .	37
4.19.1.1 HandlerFeedbackPost() . . . . .	37
4.19.2 Member Function Documentation . . . . .	37

4.19.2.1 <code>exec()</code> . . . . .	37
4.20 HandlerIndex Class Reference . . . . .	38
4.20.1 Constructor & Destructor Documentation . . . . .	38
4.20.1.1 <code>HandlerIndex()</code> . . . . .	38
4.20.2 Member Function Documentation . . . . .	38
4.20.2.1 <code>exec()</code> . . . . .	38
4.21 HandlerMap Class Reference . . . . .	39
4.21.1 Constructor & Destructor Documentation . . . . .	39
4.21.1.1 <code>HandlerMap()</code> . . . . .	39
4.21.2 Member Function Documentation . . . . .	39
4.21.2.1 <code>exec()</code> . . . . .	39
4.22 HandlerNews Class Reference . . . . .	40
4.22.1 Constructor & Destructor Documentation . . . . .	40
4.22.1.1 <code>HandlerNews()</code> . . . . .	40
4.22.2 Member Function Documentation . . . . .	40
4.22.2.1 <code>exec()</code> . . . . .	40
4.23 HandlerOrder Class Reference . . . . .	41
4.23.1 Constructor & Destructor Documentation . . . . .	41
4.23.1.1 <code>HandlerOrder()</code> . . . . .	41
4.23.2 Member Function Documentation . . . . .	41
4.23.2.1 <code>exec()</code> . . . . .	41
4.24 HandlerOrderPost Class Reference . . . . .	42
4.24.1 Constructor & Destructor Documentation . . . . .	42
4.24.1.1 <code>HandlerOrderPost()</code> . . . . .	42
4.24.2 Member Function Documentation . . . . .	42
4.24.2.1 <code>exec()</code> . . . . .	42
4.25 HandlerRenderTemplate Class Reference . . . . .	43
4.25.1 Constructor & Destructor Documentation . . . . .	43
4.25.1.1 <code>HandlerRenderTemplate()</code> . . . . .	43
4.25.2 Member Function Documentation . . . . .	43

4.25.2.1 exec()	43
4.26 HandlerTemplate Class Reference	44
4.26.1 Constructor & Destructor Documentation	44
4.26.1.1 HandlerTemplate()	44
4.26.2 Member Function Documentation	44
4.26.2.1 exec()	44
4.27 HandlerTrack Class Reference	45
4.27.1 Constructor & Destructor Documentation	45
4.27.1.1 HandlerTrack()	45
4.27.2 Member Function Documentation	45
4.27.2.1 exec()	45
4.28 Headers Class Reference	46
4.28.1 Detailed Description	46
4.28.2 Constructor & Destructor Documentation	46
4.28.2.1 Headers() [1/2]	46
4.28.2.2 ~Headers()	46
4.28.2.3 Headers() [2/2]	46
4.28.3 Member Function Documentation	47
4.28.3.1 add()	47
4.28.3.2 getHeaders()	47
4.28.3.3 getValue()	47
4.28.3.4 toString()	48
4.29 HtmlMiddleware Class Reference	48
4.29.1 Detailed Description	49
4.29.2 Constructor & Destructor Documentation	49
4.29.2.1 HtmlMiddleware()	49
4.29.2.2 ~HtmlMiddleware()	49
4.29.3 Member Function Documentation	49
4.29.3.1 autoExec()	49
4.29.3.2 exec()	50

4.29.3.3 getContext()	50
4.29.3.4 getView()	50
4.29.3.5 setView()	50
4.30 HTTP Class Reference	51
4.30.1 Detailed Description	51
4.30.2 Member Enumeration Documentation	51
4.30.2.1 Method	51
4.30.2.2 Version	52
4.30.3 Member Function Documentation	52
4.30.3.1 getMethod()	52
4.30.3.2 getReasonPhrase()	52
4.30.3.3 getVersion() [1/2]	53
4.30.3.4 getVersion() [2/2]	53
4.31 InitParams Class Reference	54
4.31.1 Detailed Description	54
4.31.2 Constructor & Destructor Documentation	54
4.31.2.1 InitParams() [1/2]	54
4.31.2.2 InitParams() [2/2]	54
4.31.3 Member Function Documentation	55
4.31.3.1 getFilePath()	55
4.31.3.2 getIP()	55
4.31.3.3 getPort()	55
4.31.3.4 isIPv6()	55
4.32 JsonMiddleware Class Reference	56
4.32.1 Detailed Description	56
4.32.2 Constructor & Destructor Documentation	56
4.32.2.1 JsonMiddleware()	56
4.32.2.2 ~JsonMiddleware()	57
4.32.3 Member Function Documentation	57
4.32.3.1 autoExec()	57

4.32.3.2 exec()	57
4.32.3.3 fillResponse()	57
4.32.3.4 getJsonRequest()	58
4.32.3.5 getJsonResponse()	58
4.33 LogManager Class Reference	58
4.33.1 Detailed Description	58
4.33.2 Constructor & Destructor Documentation	58
4.33.2.1 LogManager()	58
4.33.3 Member Function Documentation	59
4.33.3.1 operator<<() [1/2]	59
4.33.3.2 operator<<() [2/2]	59
4.34 MessageBody Class Reference	59
4.34.1 Detailed Description	60
4.34.2 Constructor & Destructor Documentation	60
4.34.2.1 MessageBody() [1/2]	60
4.34.2.2 MessageBody() [2/2]	60
4.34.3 Member Function Documentation	60
4.34.3.1 getBody()	60
4.34.3.2 setBody()	61
4.35 Middleware Class Reference	61
4.35.1 Detailed Description	62
4.35.2 Constructor & Destructor Documentation	62
4.35.2.1 Middleware()	62
4.35.2.2 ~Middleware()	62
4.35.3 Member Function Documentation	62
4.35.3.1 addValueToMap()	62
4.35.3.2 autoExec()	63
4.35.3.3 exec()	63
4.35.3.4 getMap()	63
4.35.3.5 getNameID()	63

4.35.3.6 <code>getValueFromMap()</code> . . . . .	63
4.35.3.7 <code>setContent()</code> . . . . .	64
4.35.4 Member Data Documentation . . . . .	64
4.35.4.1 <code>map</code> . . . . .	64
4.35.4.2 <code>request</code> . . . . .	64
4.35.4.3 <code>response</code> . . . . .	64
4.36 ParserHTTP Class Reference . . . . .	65
4.36.1 Detailed Description . . . . .	65
4.36.2 Member Function Documentation . . . . .	65
4.36.2.1 <code>getRequestFromStr()</code> . . . . .	65
4.36.2.2 <code>getStrFromResponse()</code> . . . . .	66
4.36.2.3 <code>getTime()</code> . . . . .	66
4.36.2.4 <code>urlDecode()</code> . . . . .	66
4.36.2.5 <code>urlEncode()</code> . . . . .	67
4.37 RedirectResponse Class Reference . . . . .	67
4.37.1 Detailed Description . . . . .	68
4.37.2 Constructor & Destructor Documentation . . . . .	68
4.37.2.1 <code>RedirectResponse()</code> . . . . .	68
4.37.3 Member Function Documentation . . . . .	68
4.37.3.1 <code>getRedirectUri()</code> . . . . .	68
4.37.3.2 <code>setPermanent()</code> . . . . .	68
4.37.3.3 <code>setRedirectCode()</code> . . . . .	68
4.37.3.4 <code>setTemporary()</code> . . . . .	69
4.38 Request Class Reference . . . . .	69
4.38.1 Detailed Description . . . . .	69
4.38.2 Constructor & Destructor Documentation . . . . .	70
4.38.2.1 <code>Request()</code> [1/2] . . . . .	70
4.38.2.2 <code>Request()</code> [2/2] . . . . .	70
4.38.2.3 <code>~Request()</code> . . . . .	70
4.38.3 Member Function Documentation . . . . .	70

4.38.3.1 getHeaders()	70
4.38.3.2 getMessageBody()	71
4.38.3.3 getMethod()	71
4.38.3.4 getURI()	71
4.38.3.5 getVersion()	71
4.39 Response Class Reference	72
4.39.1 Detailed Description	72
4.39.2 Constructor & Destructor Documentation	72
4.39.2.1 Response() [1/2]	72
4.39.2.2 Response() [2/2]	72
4.39.2.3 ~Response()	73
4.39.3 Member Function Documentation	73
4.39.3.1 getBody()	73
4.39.3.2 getHeaders()	73
4.39.3.3 getStatus()	74
4.39.3.4 getVersion()	74
4.39.3.5 setBody()	74
4.39.3.6 setHeaders()	74
4.39.3.7 setStatus()	75
4.39.3.8 setVersion()	75
4.40 RuntimeException Class Reference	75
4.40.1 Detailed Description	76
4.40.2 Constructor & Destructor Documentation	76
4.40.2.1 RuntimeException()	76
4.40.3 Member Function Documentation	76
4.40.3.1 what()	76
4.41 Socket Class Reference	77
4.41.1 Detailed Description	77
4.41.2 Constructor & Destructor Documentation	77
4.41.2.1 Socket() [1/2]	77

4.41.2.2 Socket() [2/2] . . . . .	77
4.41.2.3 ~Socket() . . . . .	78
4.41.3 Member Function Documentation . . . . .	78
4.41.3.1 getData() . . . . .	78
4.41.3.2 init() . . . . .	78
4.41.3.3 receiveData() . . . . .	79
4.41.3.4 toString() . . . . .	79
4.42 URI Class Reference . . . . .	79
4.42.1 Detailed Description . . . . .	80
4.42.2 Constructor & Destructor Documentation . . . . .	80
4.42.2.1 URI() [1/2] . . . . .	80
4.42.2.2 URI() [2/2] . . . . .	80
4.42.3 Member Function Documentation . . . . .	80
4.42.3.1 getParams() . . . . .	80
4.42.3.2 getPath() . . . . .	81
4.42.3.3 getRawData() . . . . .	81
4.42.3.4 getValueFromParam() . . . . .	81
4.42.3.5 setParamsAndUri() . . . . .	82
<b>5 File Documentation</b>	<b>83</b>

# Chapter 1

## Hierarchical Index

### 1.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

App	7
Context	11
CookieEntity	15
DBManager	19
exception	
RuntimeException	75
Handler	25
FileHandler	21
HandlerApi	28
HandlerCalculate	29
HandlerCalculatePost	30
HandlerCommon	31
HandlerCommonInfo	32
HandlerCookie	33
HandlerEstimate	34
HandlerEstimatePost	35
HandlerFeedback	36
HandlerFeedbackPost	37
HandlerIndex	38
HandlerMap	39
HandlerNews	40
HandlerOrder	41
HandlerOrderPost	42
HandlerRenderTemplate	43
HandlerTemplate	44
HandlerTrack	45
Headers	46
HTTP	51
InitParams	54
LogManager	58
MessageBody	59
Middleware	61
CookieMiddleware	17
FormMiddleware	23
HtmlMiddleware	48

JsonMiddleware . . . . .	56
ParserHTTP . . . . .	65
Request . . . . .	69
Response . . . . .	72
DefaultResponse . . . . .	20
RedirectResponse . . . . .	67
Socket . . . . .	77
URI . . . . .	79

## Chapter 2

# Class Index

### 2.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

<a href="#">App</a>	The main class of the framework. Each object of this class is an independent web-application, which could be configured by handlers, middleware etc . . . . .	7
<a href="#">Context</a>	This class is wrapper for important data (like <a href="#">Response</a> , <a href="#">DB</a> , <a href="#">Middleware</a> etc.), which is needed to handlers . . . . .	11
<a href="#">CookieEntity</a>	Class wrapper for Cookies. Allow you adjust parameters of each http cookie. Used by <a href="#">CookieMiddleware</a> . . . . .	15
<a href="#">CookieMiddleware</a>	Inherited class to parse cookie from http request . . . . .	17
<a href="#">DBManager</a>	Allow perform sql queries to db . . . . .	19
<a href="#">DefaultResponse</a>	<a href="#">Response</a> class which is intended to make sample html pages on status codes . . . . .	20
<a href="#">FileHandler</a>	This class allow you to set any file of filesystem as response body . . . . .	21
<a href="#">FormMiddleware</a>	Inherited class to parse application/x-www-form-urlencoded . . . . .	23
<a href="#">Handler</a>	Object of this class executes every time on new request, this object (and others) construct response to client . . . . .	25
<a href="#">HandlerApi</a>	. . . . .	28
<a href="#">HandlerCalculate</a>	. . . . .	29
<a href="#">HandlerCalculatePost</a>	. . . . .	30
<a href="#">HandlerCommon</a>	. . . . .	31
<a href="#">HandlerCommonInfo</a>	. . . . .	32
<a href="#">HandlerCookie</a>	. . . . .	33
<a href="#">HandlerEstimate</a>	. . . . .	34
<a href="#">HandlerEstimatePost</a>	. . . . .	35
<a href="#">HandlerFeedback</a>	. . . . .	36
<a href="#">HandlerFeedbackPost</a>	. . . . .	37
<a href="#">HandlerIndex</a>	. . . . .	38
<a href="#">HandlerMap</a>	. . . . .	39
<a href="#">HandlerNews</a>	. . . . .	40

<a href="#">HandlerOrder</a>	41
<a href="#">HandlerOrderPost</a>	42
<a href="#">HandlerRenderTemplate</a>	43
<a href="#">HandlerTemplate</a>	44
<a href="#">HandlerTrack</a>	45
<a href="#">Headers</a>	
Wrapper class for http headers	46
<a href="#">HtmlMiddleware</a>	
Inherited class to render html pages from templates	48
<a href="#">HTTP</a>	
Static class describes http method, version, and allow to convert it from/to string/enumeration	51
<a href="#">InitParams</a>	
<a href="#">InitParams</a> is intended to get web-server configs from command line arguments	54
<a href="#">JsonMiddleware</a>	
Inherited class to perform any actions with json data	56
<a href="#">LogManager</a>	
Logging info into file	58
<a href="#">MessageBody</a>	
Wrapper class for http body	59
<a href="#">Middleware</a>	
Class wrapper for middleware	61
<a href="#">ParserHTTP</a>	
Static class for parsing, encoding, decoding any http data	65
<a href="#">RedirectResponse</a>	
<a href="#">Response</a> class which is intended to make http redirects	67
<a href="#">Request</a>	
Class wrapper of <a href="#">HTTP</a> request	69
<a href="#">Response</a>	
Class wrapper of <a href="#">HTTP</a> response	72
<a href="#">RuntimeException</a>	
Exception class for program errors	75
<a href="#">Socket</a>	
Wrapper functions to send/receive data via web-sockets	77
<a href="#">URI</a>	
Class represents http uri	79

## Chapter 3

# File Index

### 3.1 File List

Here is a list of all files with brief descriptions:

/home/a_krava/projects/progbase3/web_server/main.cpp . . . . .	92
/home/a_krava/projects/progbase3/web_server/include/app.h . . . . .	83
/home/a_krava/projects/progbase3/web_server/include/context.h . . . . .	83
/home/a_krava/projects/progbase3/web_server/include/cookie_entity.h . . . . .	84
/home/a_krava/projects/progbase3/web_server/include/cookie_middleware.h . . . . .	84
/home/a_krava/projects/progbase3/web_server/include/db_manager.h . . . . .	85
/home/a_krava/projects/progbase3/web_server/include/default_response.h . . . . .	85
/home/a_krava/projects/progbase3/web_server/include/file_handler.h . . . . .	85
/home/a_krava/projects/progbase3/web_server/include/form_middleware.h . . . . .	86
/home/a_krava/projects/progbase3/web_server/include/handler.h . . . . .	86
/home/a_krava/projects/progbase3/web_server/include/headers.h . . . . .	86
/home/a_krava/projects/progbase3/web_server/include/html_middleware.h . . . . .	87
/home/a_krava/projects/progbase3/web_server/include/http.h . . . . .	87
/home/a_krava/projects/progbase3/web_server/include/init_params.h . . . . .	88
/home/a_krava/projects/progbase3/web_server/include/json_middleware.h . . . . .	88
/home/a_krava/projects/progbase3/web_server/include/log_manager.h . . . . .	88
/home/a_krava/projects/progbase3/web_server/include/message_body.h . . . . .	89
/home/a_krava/projects/progbase3/web_server/include/middleware.h . . . . .	89

/home/a_krava/projects/progbase3/web_server/src/response.cpp . . . . .	98
/home/a_krava/projects/progbase3/web_server/src/socket.cpp . . . . .	98
/home/a_krava/projects/progbase3/web_server/src/uri.cpp . . . . .	98

## Chapter 4

# Class Documentation

### 4.1 App Class Reference

The main class of the framework. Each object of this class is an independent web-application, which could be configured by handlers, middleware etc.

```
#include <app.h>
```

Collaboration diagram for App:

#### Public Member Functions

- [App](#) (std::string &ip, int port=80, bool isIPv6=false, const char \*logFilePath=nullptr)
- [App](#) (InitParams &params)
- [~App](#) ()
- bool [init](#) ()
- void [addHandler](#) ([Handler](#) \*handler)
- void [addPermanentlyRedirect](#) (const char \*uri, const char \*target)
- void [addTemporaryRedirect](#) (const char \*uri, const char \*target)
- void [addRedirect](#) (const char \*uri, const char \*target, int code)
- void [addMiddleware](#) ([Middleware](#) \*middleware)
- void [run](#) ()

### 4.1.1 Detailed Description

The main class of the framework. Each object of this class is an independent web-application, which could be configured by handlers, middleware etc.

This class implements web-application, which is running on given and port. It supports IPv6 and can capture log in the file if given. Use Handlers, [Middleware](#) and set Redirects to adjust it.

### 4.1.2 Constructor & Destructor Documentation

#### 4.1.2.1 App() [1/2]

```
App::App (
    std::string & ip,
    int port = 80,
    bool isIPv6 = false,
    const char * logFilePath = nullptr ) [explicit]
```

Create a new web application, which is only adjusted to ip address. You can init this and add some handlers etc. to run this

##### Parameters

<i>ip</i>	text representation of ip address, like 127.0.0.1 or 0:0:0:0:0:0:1 (if IPv6)
<i>port</i>	port in range [0, 65535]
<i>isIPv6</i>	set true, if param ip is version 6
<i>logFilePath</i>	if you want to create log file, give a file path, or null otherwise

#### 4.1.2.2 App() [2/2]

```
App::App (
    InitParams & params ) [explicit]
```

Create a new web application, by command line arguments using [InitParams](#) object

##### Parameters

<i>params</i>	Give an object params, which was created by <a href="#">InitParams</a> class from command line arguments
---------------	----------------------------------------------------------------------------------------------------------

#### 4.1.2.3 ~App()

```
App::~App ( )
```

Destructor delete all added handlers and all middleware

### 4.1.3 Member Function Documentation

#### 4.1.3.1 addHandler()

```
void App::addHandler (
    Handler * handler )
```

To configure your application create and add some handlers

##### Parameters

<i>handler</i>	object of class <a href="#">Handler</a> (could be inherited) with overridden function exec
----------------	--------------------------------------------------------------------------------------------

#### 4.1.3.2 addMiddleware()

```
void App::addMiddleware (
    Middleware * middleware )
```

Add object of class [Middleware](#), which has got overridden function exec to do given operations on every request. All handlers could access to any middleware and perform adjusted actions.

##### Parameters

<i>middleware</i>	object of class <a href="#">Middleware</a> (could be inherited)
-------------------	-----------------------------------------------------------------

#### 4.1.3.3 addPermanentlyRedirect()

```
void App::addPermanentlyRedirect (
    const char * uri,
    const char * target )
```

Add redirection, which is meant to last forever. The original URL should not be used anymore and that the new one is preferred. Search engine robots trigger an update of the associated URL for the resource in their indexes. ([HTTP code 301](#))

##### Parameters

<i>uri</i>	original uri path, which is deprecated (outdated)
<i>target</i>	new uri address of mentioned page

#### 4.1.3.4 addRedirect()

```
void App::addRedirect (
    const char * uri,
    const char * target,
    int code )
```

To adjust any redirection using status code. For example, 304 (Not Modified) redirects a page to the locally cached copy, and 300 (Multiple Choice) is a manual redirection: the body, presented by the browser as a Web page, lists the possible redirection and the user clicks on one to select it.

##### Parameters

<i>uri</i>	original uri path, which is deprecated (outdated)
<i>target</i>	new uri address of mentioned page
<i>code</i>	<a href="#">HTTP</a> code redirection status of response

#### 4.1.3.5 addTemporaryRedirect()

```
void App::addTemporaryRedirect (
    const char * uri,
    const char * target )
```

Temporary redirect can be used, if for some time the requested resource cannot be accessed from its canonical location, but it can be accessed from another place. Search engine robots don't memorize the new, temporary link. Temporary redirection are also used when creating, updating and deleting resources to present temporary progress pages.

##### Parameters

<i>uri</i>	original uri path, which is deprecated (outdated)
<i>target</i>	new uri address of mentioned page

#### 4.1.3.6 init()

```
bool App::init ( )
```

Use this function to open socket for listening on declared ip address and port. After creating on object you should use this function to startup web-socket

##### Returns

true if ip address and port were valid and available, false - otherwise, please, use another address to continue

## 4.1.3.7 run()

```
void App::run ( )
```

Start listening for request. This method startup the system, where on every request from clients all added handlers and middleware create a response and send it to client.

The documentation for this class was generated from the following files:

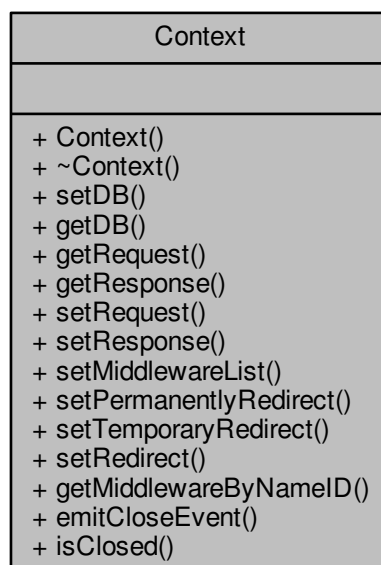

- /home/a\_krava/projects/progbase3/web\_server/include/app.h
- /home/a\_krava/projects/progbase3/web\_server/src/app.cpp

## 4.2 Context Class Reference

This class is wrapper for important data (like [Response](#), DB, [Middleware](#) etc.), which is needed to handlers.

```
#include <context.h>
```

Collaboration diagram for Context:

## Public Member Functions

- [Context](#) ()
- [~Context](#) ()
- void [setDB](#) ([DBManager](#) \*db)
- [DBManager](#) \* [getDB](#) ()
- [Request](#) \* [getRequest](#) ()
- [Response](#) \* [getResponse](#) ()
- void [setRequest](#) ([Request](#) \*request)
- void [setResponse](#) ([Response](#) \*response)
- void [setMiddlewareList](#) (std::vector< [Middleware](#) \*> \*middlewareList)
- void [setPermanentlyRedirect](#) (const char \*uri)
- void [setTemporaryRedirect](#) (const char \*uri)
- void [setRedirect](#) (const char \*uri, int code)
- [Middleware](#) \* [getMiddlewareByNameID](#) (const char \*nameID)
- void [emitCloseEvent](#) ()
- bool [isClosed](#) ()

### 4.2.1 Detailed Description

This class is wrapper for important data (like [Response](#), DB, [Middleware](#) etc.), which is needed to handlers.

This class collects a data about current request, which was parsed from str, have a pointer to [Response](#) object, which will be serialized to client in future (here could be some written data from previous responses), also there are references to all added middleware (you could get some by id) and database, which is ready to perform method exec

### 4.2.2 Constructor & Destructor Documentation

#### 4.2.2.1 Context()

```
Context::Context ( )
```

Constructor create an object of this class: creating [Request](#) and [Response](#) objects, and setting NULL to db and middlewareList

#### 4.2.2.2 ~Context()

```
Context::~Context ( )
```

Deleting [Request](#), [Response](#) and DB objects, if they are not NULL

### 4.2.3 Member Function Documentation

#### 4.2.3.1 emitCloseEvent()

```
void Context::emitCloseEvent ( )
```

Emit signal to stop executing operation. [Handler](#), which used this will be last executed handler in app

#### 4.2.3.2 getDB()

```
DBManager * Context::getDB ( )
```

Returns db, if wasn't set - nullptr

##### Returns

Object of class [DBManager](#)

#### 4.2.3.3 getMiddlewareByNameID()

```
Middleware * Context::getMiddlewareByNameID (
    const char * nameID )
```

Method returns added [Middleware](#) by id (in string)

##### Parameters

<i>nameID</i>	id of middleware, which was set at startup
---------------	--------------------------------------------

##### Returns

object of [Middleware](#) (could be inherited)

#### 4.2.3.4 getRequest()

```
Request * Context::getRequest ( )
```

Gives current request

##### Returns

object of [Request](#) class

#### 4.2.3.5 `getResponse()`

```
Response * Context::getResponse ( )
```

Gives current response. Could be modified by previous handlers

##### Returns

object of [Response](#) class

#### 4.2.3.6 `isClosed()`

```
bool Context::isClosed ( )
```

Checks, if handlers emitted `CloseEvent`

##### Returns

true, if there were emitted close event, false otherwise

#### 4.2.3.7 `setDB()`

```
void Context::setDB (
    DBManager * db )
```

Method sets the object of database, created by [DBManager](#). All handlers can access it

##### Parameters

<i>db</i>	Object of class <a href="#">DBManager</a>
-----------	-------------------------------------------

#### 4.2.3.8 `setMiddlewareList()`

```
void Context::setMiddlewareList (
    std::vector< Middleware *> * middlewareList )
```

sets vector of [Middleware](#) objects, which can be accessed by handlers

##### Parameters

<i>middlewareList</i>	std::vector of <a href="#">Middleware</a> objects
-----------------------	---------------------------------------------------

#### 4.2.3.9 setPermanentlyRedirect()

```
void Context::setPermanentlyRedirect (
    const char * uri )
```

Set permanent (code 301) redirect headers to [Response](#)

##### Parameters

<i>uri</i>	destination uri, where current request will be redirected
------------	-----------------------------------------------------------

#### 4.2.3.10 setRedirect()

```
void Context::setRedirect (
    const char * uri,
    int code )
```

Set redirect headers to [Response](#)

##### Parameters

<i>uri</i>	destination uri, where current request will be redirected
<i>code</i>	http code of redirect

#### 4.2.3.11 setRequest()

```
void Context::setRequest (
    Request * request )
```

Deleting existing [Request](#) and setting new one

##### Parameters

<i>request</i>	object of <a href="#">Request</a> class (could be inherited)
----------------	--------------------------------------------------------------

#### 4.2.3.12 setResponse()

```
void Context::setResponse (
    Response * response )
```

Deleting existing [Response](#) and setting new one

## Parameters

<i>response</i>	object of <a href="#">Response</a> class (could be inherited)
-----------------	---------------------------------------------------------------

## 4.2.3.13 setTemporaryRedirect()

```
void Context::setTemporaryRedirect (
    const char * uri )
```

Set temporary (code 302) redirect headers to [Response](#)

## Parameters

<i>uri</i>	destination uri, where current request will be redirected
------------	-----------------------------------------------------------

The documentation for this class was generated from the following files:

- /home/a\_krava/projects/progbase3/web\_server/include/[context.h](#)
- /home/a\_krava/projects/progbase3/web\_server/src/[context.cpp](#)

## 4.3 CookieEntity Class Reference

Class wrapper for Cookies. Allow you adjust parameters of each http cookie. Used by [CookieMiddleware](#).

```
#include <cookie_entity.h>
```

Collaboration diagram for CookieEntity:

## Public Member Functions

- [CookieEntity](#) (const char \*value, time\_t expires=-1, size\_t maxAge\_sec=std::string::npos, const char \*domain=nullptr, const char \*path=nullptr, bool httpOnly=false)
- std::string [toString](#) ()

### 4.3.1 Detailed Description

Class wrapper for Cookies. Allow you adjust parameters of each http cookie. Used by [CookieMiddleware](#).

Object of this class consist of key-value pair, and some options for it, like date expires, max age, domain, path, option http only

### 4.3.2 Constructor & Destructor Documentation

#### 4.3.2.1 CookieEntity()

```
CookieEntity::CookieEntity (
    const char * value,
    time_t expires = -1,
    size_t maxAge_sec = std::string::npos,
    const char * domain = nullptr,
    const char * path = nullptr,
    bool httpOnly = false )
```

Constructs a cookie entity with parameters

#### Parameters

<i>value</i>	value of cookie
<i>expires</i>	the maximum lifetime of the cookie as time_t
<i>maxAge_sec</i>	number of seconds until the cookie expires.
<i>domain</i>	specifies those hosts to which the cookie will be sent.
<i>path</i>	indicates a URL path that must exist in the requested resource before sending the Cookie header
<i>httpOnly</i>	<a href="#">HTTP</a> -only cookies aren't accessible via JavaScript

### 4.3.3 Member Function Documentation

#### 4.3.3.1 toString()

```
std::string CookieEntity::toString ( )
```

Method is used to serialize itself

#### Returns

serialized string like: "<cookie-value>; Expires=<date>; Max-Age=<non-zero-digit> ..."

The documentation for this class was generated from the following files:

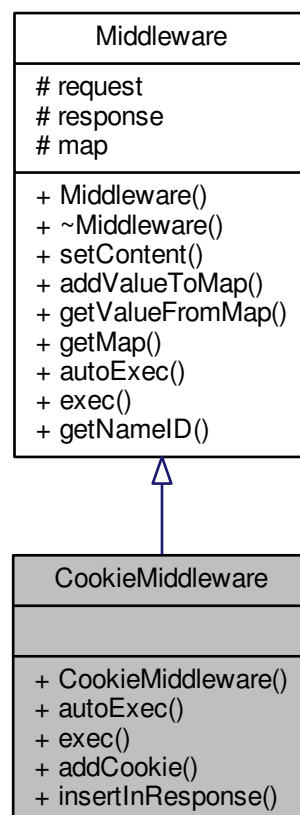

- [/home/a\\_krava/projects/progbase3/web\\_server/include/cookie\\_entity.h](#)
- [/home/a\\_krava/projects/progbase3/web\\_server/src/cookie\\_entity.cpp](#)

## 4.4 CookieMiddleware Class Reference

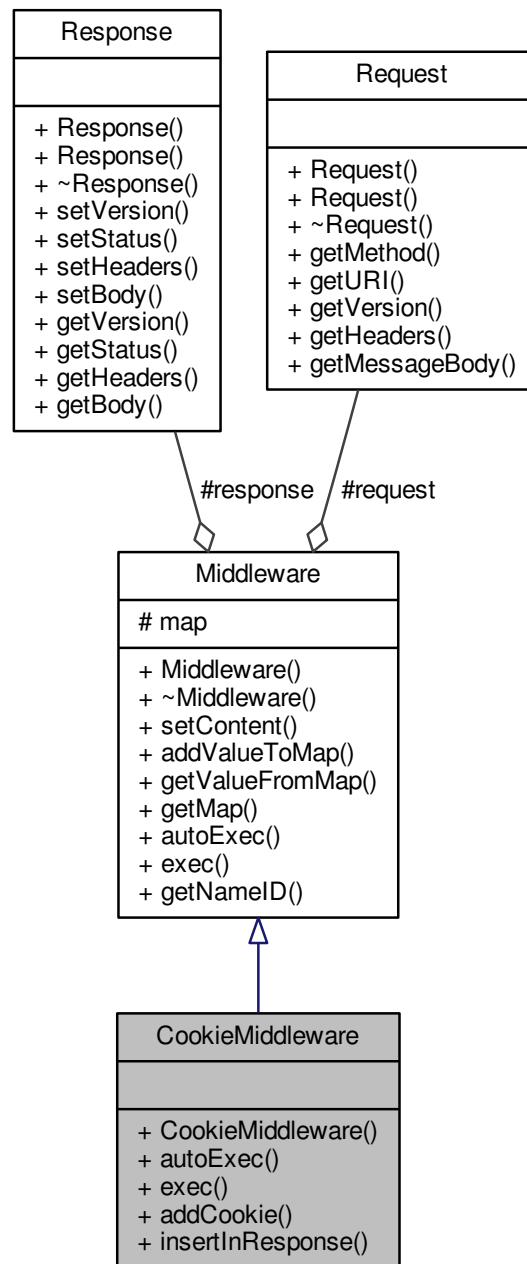

inherited class to parse cookie from http request

```
#include <cookie_middleware.h>
```

Inheritance diagram for CookieMiddleware:

Collaboration diagram for CookieMiddleware:

## Public Member Functions

- [CookieMiddleware](#) (const char \*nameID)
- bool [autoExec](#) ()
- void [exec](#) ()
- void [addCookie](#) (const char \*key, [CookieEntity](#) &value)
- void [insertInResponse](#) ()

## Additional Inherited Members

### 4.4.1 Detailed Description

inherited class to parse cookie from http request

[CookieMiddleware](#) is intended to parse cookie from http request, fill response with cookies

### 4.4.2 Constructor & Destructor Documentation

#### 4.4.2.1 CookieMiddleware()

```
CookieMiddleware::CookieMiddleware (
    const char * nameID )
```

create middleware

##### Parameters

<i>nameID</i>	name id
---------------	---------

### 4.4.3 Member Function Documentation

#### 4.4.3.1 addCookie()

```
void CookieMiddleware::addCookie (
    const char * key,
    CookieEntity & value )
```

add [CookieEntity](#) to response cookies

##### Parameters

<i>key</i>	key for entity
<i>value</i>	<a href="#">CookieEntity</a> object

#### 4.4.3.2 autoExec()

```
bool CookieMiddleware::autoExec ( ) [virtual]
```

Check if there are cookie in request

#### Returns

true, if there are cookie in request

Implements [Middleware](#).

#### 4.4.3.3 exec()

```
void CookieMiddleware::exec ( ) [virtual]
```

parse cookies from http request

Implements [Middleware](#).

#### 4.4.3.4 insertInResponse()

```
void CookieMiddleware::insertInResponse ( )
```

set response cookies in response headers

The documentation for this class was generated from the following files:

- /home/a\_krava/projects/progbase3/web\_server/include/[cookie\\_middleware.h](#)
- /home/a\_krava/projects/progbase3/web\_server/src/[cookie\\_middleware.cpp](#)

## 4.5 DBManager Class Reference

allow perform sql queries to db

```
#include <db_manager.h>
```

Collaboration diagram for DBManager:

## Public Member Functions

- [DBManager](#) (const char \*filePath)
- [~DBManager](#) ()
- bool [execQuery](#) (const char \*statement, std::vector< std::vector< std::string >> &result\_vec, char \*data[], int num)

### 4.5.1 Detailed Description

allow perform sql queries to db

Realisation of wrapper for SQLite database

### 4.5.2 Constructor & Destructor Documentation

#### 4.5.2.1 DBManager()

```
DBManager::DBManager (
    const char * filePath )
```

Opening database

##### Parameters

<i>filePath</i>	file path to database
-----------------	-----------------------

#### 4.5.2.2 ~DBManager()

```
DBManager::~DBManager ( )
```

Closing opened connection to db

### 4.5.3 Member Function Documentation

#### 4.5.3.1 execQuery()

```
bool DBManager::execQuery (
    const char * statement,
    std::vector< std::vector< std::string >> & result_vec,
    char * data[],
    int num )
```

Execute SQL statement, with binding values by escaping with '?' in statement and including them in data array

**Parameters**

<i>statement</i>	SQL query
<i>result_vec</i>	out parameter, used to write result table of executed query
<i>data</i>	some data can be missed by ? in statement. So it's providing in this data array
<i>num</i>	number of binding (preparing) values

**Returns**

true if executed successfully, false otherwise

The documentation for this class was generated from the following files:

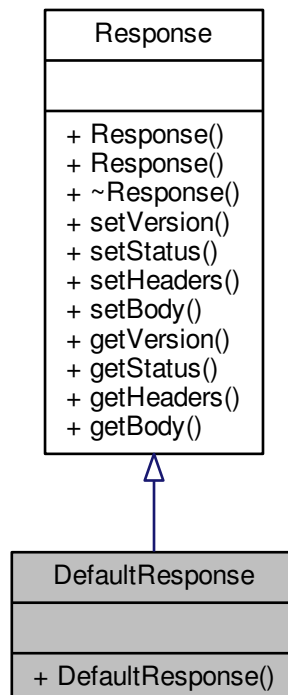

- [/home/a\\_krava/projects/progbase3/web\\_server/include/db\\_manager.h](#)
- [/home/a\\_krava/projects/progbase3/web\\_server/src/db\\_manager.cpp](#)

## 4.6 DefaultResponse Class Reference

[Response](#) class which is intended to make sample html pages on status codes.

```
#include <default_response.h>
```

Inheritance diagram for DefaultResponse:

Collaboration diagram for DefaultResponse:

## Public Member Functions

- [DefaultResponse](#) (int status\_code, const char \*body=nullptr)

### 4.6.1 Detailed Description

[Response](#) class which is intended to make sample html pages on status codes.

Inherited class [DefaultResponse](#) from [Response](#) for setting stubs for non-realized functionality

### 4.6.2 Constructor & Destructor Documentation

#### 4.6.2.1 DefaultResponse()

```

DefaultResponse::DefaultResponse (
    int status_code,
    const char * body = nullptr )
  
```

Create [DefaultResponse](#) with code status or custom body

## Parameters

<i>status_code</i>	http code status, set the body for its reason phrase, if <code>status_code &lt; 0</code> , set the body from param body
<i>body</i>	custom body page

The documentation for this class was generated from the following files:

- [/home/a\\_krava/projects/progbase3/web\\_server/include/default\\_response.h](#)
- [/home/a\\_krava/projects/progbase3/web\\_server/src/default\\_response.cpp](#)

## 4.7 FileHandler Class Reference

this class allow you to set any file of filesystem as response body

```
#include <file_handler.h>
```

Inheritance diagram for FileHandler:

Collaboration diagram for FileHandler:

### Public Member Functions

- [FileHandler](#) (const char \*route, const char \*filePath, const char \*mimeType, bool isBinary)
- void [exec](#) ()

### Static Public Member Functions

- static bool [loadFile](#) (const char \*filePath, std::string &data)

### Additional Inherited Members

#### 4.7.1 Detailed Description

this class allow you to set any file of filesystem as response body

[FileHandler](#) can handle as text files (like css, js), as binary data (img, png others)

#### 4.7.2 Constructor & Destructor Documentation

#### 4.7.2.1 FileHandler()

```
FileHandler::FileHandler (
    const char * route,
    const char * filePath,
    const char * mimeType,
    bool isBinary )
```

create file handlers with specified uri route, file path, content type etc.

##### Parameters

<i>route</i>	uri route file
<i>filePath</i>	local file path
<i>mimeType</i>	content type
<i>isBinary</i>	if file is binary, set true, false if it's text.

### 4.7.3 Member Function Documentation

#### 4.7.3.1 exec()

```
void FileHandler::exec ( ) [virtual]
```

make http body of response object as file in filePath

Implements [Handler](#).

#### 4.7.3.2 loadFile()

```
bool FileHandler::loadFile (
    const char * filePath,
    std::string & data ) [static]
```

static function that read all data from file to string

##### Parameters

<i>filePath</i>	path to file
<i>data</i>	out param, if can read file, it will be written to data,do nothing otherwise

##### Returns

true, if read successfully, false otherwise

The documentation for this class was generated from the following files:

- [/home/a\\_krava/projects/progbase3/web\\_server/include/file\\_handler.h](#)
- [/home/a\\_krava/projects/progbase3/web\\_server/src/file\\_handler.cpp](#)

## 4.8 FormMiddleware Class Reference

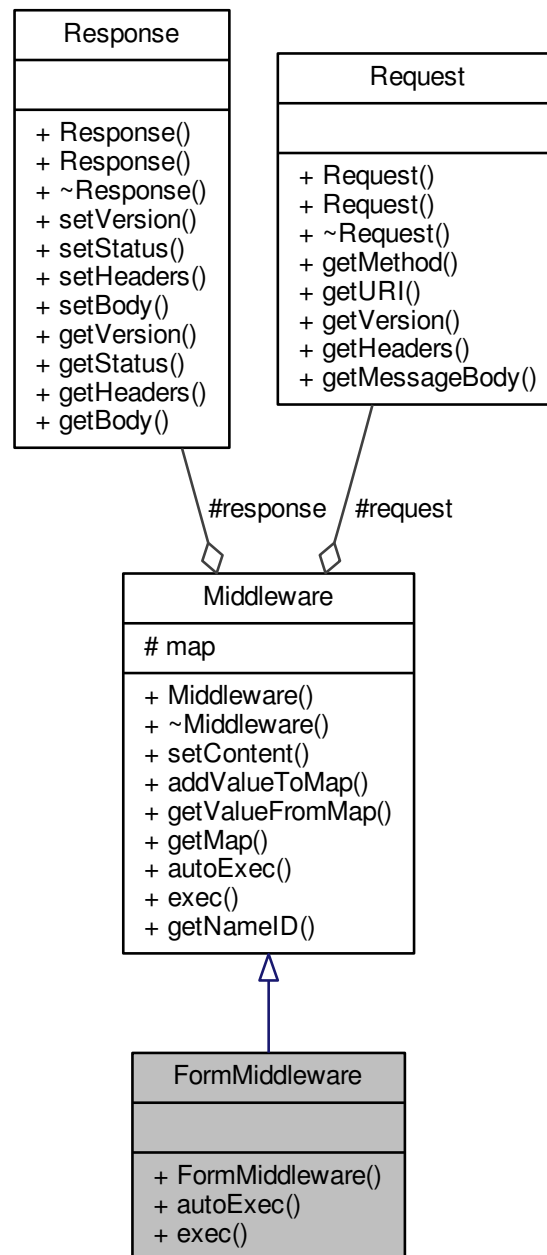

inherited class to parse application/x-www-form-urlencoded

```
#include <form_middleware.h>
```

Inheritance diagram for FormMiddleware:

Collaboration diagram for FormMiddleware:

## Public Member Functions

- [FormMiddleware](#) (const char \*nameID)
- bool [autoExec](#) ()
- void [exec](#) ()

## Additional Inherited Members

### 4.8.1 Detailed Description

inherited class to parse application/x-www-form-urlencoded

[FormMiddleware](#) is intended to parse forms from http request and decode it

### 4.8.2 Constructor & Destructor Documentation

#### 4.8.2.1 FormMiddleware()

```
FormMiddleware::FormMiddleware (
    const char * nameID ) [inline]
```

create middleware

#### Parameters

<i>nameID</i>	name id
---------------	---------

### 4.8.3 Member Function Documentation

#### 4.8.3.1 autoExec()

```
bool FormMiddleware::autoExec ( ) [virtual]
```

Check if request is application/x-www-form-urlencoded

#### Returns

true, if content type of http request is form

Implements [Middleware](#).

#### 4.8.3.2 exec()

```
void FormMiddleware::exec ( ) [virtual]
```

parse form in http request

Implements [Middleware](#).

The documentation for this class was generated from the following files:

- /home/a\_krava/projects/progbase3/web\_server/include/[form\\_middleware.h](#)
- /home/a\_krava/projects/progbase3/web\_server/src/[form\\_middleware.cpp](#)

### 4.9.1 Detailed Description

object of this class executes every time on new request, this object (and others) construct response to client

[Handler](#) object can be common (will execute on every response) or adjusted to some specified uri path. It can get all info about request, use added middleware, and make response

### 4.9.2 Constructor & Destructor Documentation

#### 4.9.2.1 Handler()

```
Handler::Handler (
    const char * route = nullptr,
    HTTP::Method method = HTTP::Method::ANY )
```

create handler with params: common or routed one

##### Parameters

<i>route</i>	uri path route, if null - handler will be common
<i>method</i>	uri method, if ANY will be executed on any methods

#### 4.9.2.2 ~Handler()

```
virtual Handler::~Handler ( ) [inline], [virtual]
```

destructs local variables

### 4.9.3 Member Function Documentation

#### 4.9.3.1 exec()

```
virtual void Handler::exec ( ) [pure virtual]
```

this method will be executed on every request (or uri path if set)

Implemented in [HandlerApi](#), [HandlerFeedbackPost](#), [HandlerFeedback](#), [HandlerNews](#), [HandlerCommonInfo](#), [HandlerOrderPost](#), [HandlerOrder](#), [HandlerMap](#), [HandlerEstimatePost](#), [HandlerEstimate](#), [HandlerCalculatePost](#), [HandlerCalculate](#), [HandlerTrack](#), [HandlerIndex](#), [HandlerRenderTemplate](#), [HandlerCookie](#), [HandlerTemplate](#), [FileHandler](#), and [HandlerCommon](#).

#### 4.9.3.2 getContext()

```
Context * Handler::getContext ( ) [protected]
```

get current context

##### Returns

current [Context](#) object

#### 4.9.3.3 getMethod()

```
HTTP::Method Handler::getMethod ( )
```

get [Context](#) object

##### Returns

current [Context](#) object

#### 4.9.3.4 getRoute()

```
std::string Handler::getRoute ( )
```

get route of handler

##### Returns

uri http route path

#### 4.9.3.5 isRouted()

```
bool Handler::isRouted ( )
```

check, if route is set

##### Returns

true, if handler for specified route, false if it's common one

#### 4.9.3.6 setContext()

```
void Handler::setContext (
    Context * context )
```

set [Context](#) object

## Parameters

<i>context</i>	<a href="#">Context</a> object
----------------	--------------------------------

The documentation for this class was generated from the following files:

- [/home/a\\_krava/projects/progbase3/web\\_server/include/handler.h](#)
- [/home/a\\_krava/projects/progbase3/web\\_server/src/handler.cpp](#)

## 4.10 HandlerApi Class Reference

Inheritance diagram for HandlerApi:

Collaboration diagram for HandlerApi:

## Public Member Functions

- [HandlerApi](#) (const char \*ds, [HTTP::Method](#) m)
- void [exec](#) ()

## Additional Inherited Members

### 4.10.1 Constructor & Destructor Documentation

#### 4.10.1.1 HandlerApi()

```
HandlerApi::HandlerApi (
    const char * ds,
    HTTP::Method m ) [inline]
```

### 4.10.2 Member Function Documentation

## 4.10.2.1 exec()

```
void HandlerApi::exec ( ) [inline], [virtual]
```

this method will be executed on every request (or uri path if set)

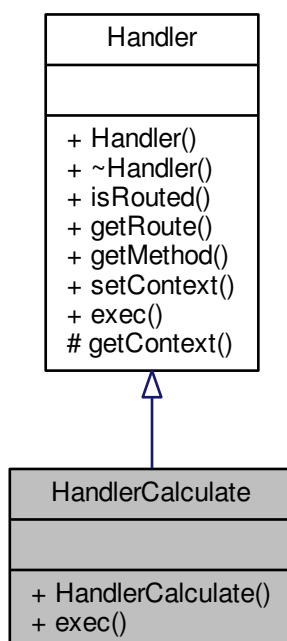

Implements [Handler](#).

The documentation for this class was generated from the following file:

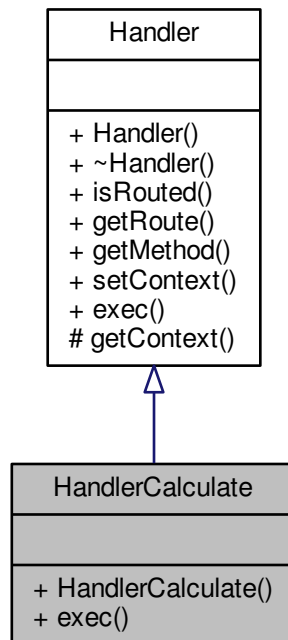

- /home/a\_krava/projects/progbase3/web\_server/main.cpp

## 4.11 HandlerCalculate Class Reference

Inheritance diagram for HandlerCalculate:

Collaboration diagram for HandlerCalculate:

## Public Member Functions

- [HandlerCalculate](#) (const char \*ds, [HTTP::Method](#) m)
- void [exec](#) ()

## Additional Inherited Members

### 4.11.1 Constructor & Destructor Documentation

#### 4.11.1.1 HandlerCalculate()

```
HandlerCalculate::HandlerCalculate (
    const char * ds,
    HTTP::Method m ) [inline]
```

### 4.11.2 Member Function Documentation

## 4.11.2.1 exec()

```
void HandlerCalculate::exec ( ) [inline], [virtual]
```

this method will be executed on every request (or uri path if set)

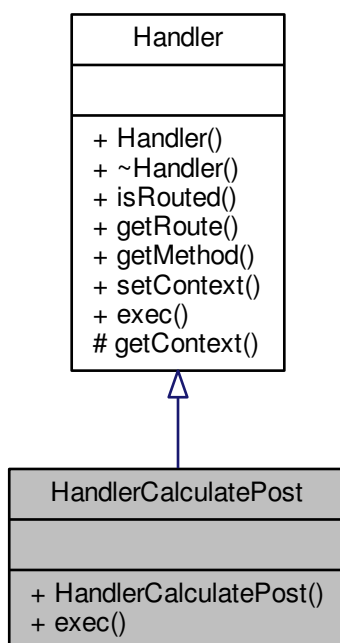

Implements [Handler](#).

The documentation for this class was generated from the following file:

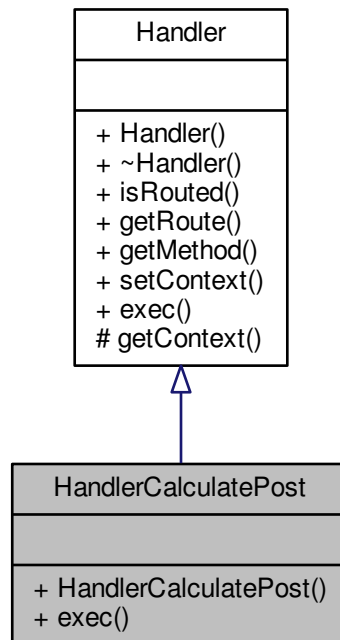

- /home/a\_krava/projects/progbase3/web\_server/[main.cpp](#)

## 4.12 HandlerCalculatePost Class Reference

Inheritance diagram for HandlerCalculatePost:

Collaboration diagram for HandlerCalculatePost:

## Public Member Functions

- [HandlerCalculatePost](#) (const char \*ds, [HTTP::Method](#) m)
- void [exec](#) ()

## Additional Inherited Members

### 4.12.1 Constructor & Destructor Documentation

#### 4.12.1.1 HandlerCalculatePost()

```

HandlerCalculatePost::HandlerCalculatePost (
    const char * ds,
    HTTP::Method m ) [inline]
  
```

### 4.12.2 Member Function Documentation

## 4.12.2.1 exec()

```
void HandlerCalculatePost::exec ( ) [inline], [virtual]
```

this method will be executed on every request (or uri path if set)

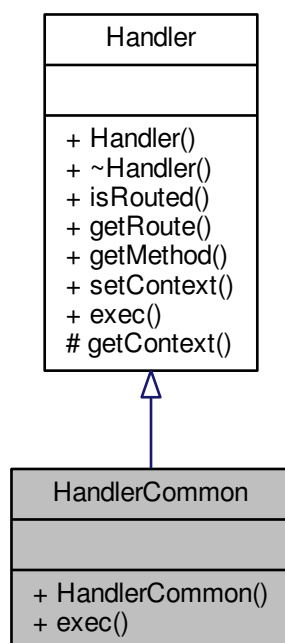

Implements [Handler](#).

The documentation for this class was generated from the following file:

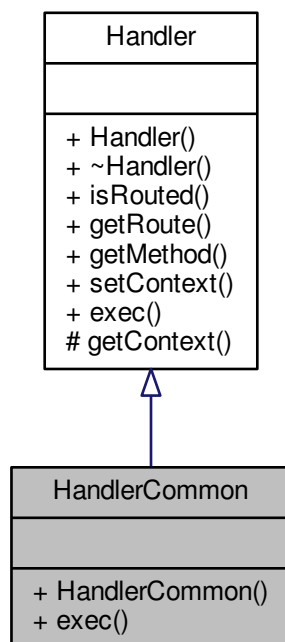

- /home/a\_krava/projects/progbase3/web\_server/[main.cpp](#)

## 4.13 HandlerCommon Class Reference

Inheritance diagram for HandlerCommon:

Collaboration diagram for HandlerCommon:

## Public Member Functions

- [HandlerCommon](#) ()
- void [exec](#) ()

## Additional Inherited Members

### 4.13.1 Constructor & Destructor Documentation

#### 4.13.1.1 HandlerCommon()

```
HandlerCommon::HandlerCommon ( ) [inline]
```

### 4.13.2 Member Function Documentation

## 4.13.2.1 exec()

```
void HandlerCommon::exec ( ) [inline], [virtual]
```

this method will be executed on every request (or uri path if set)

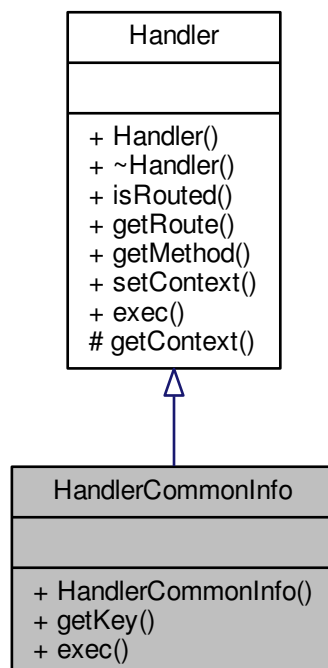

Implements [Handler](#).

The documentation for this class was generated from the following file:

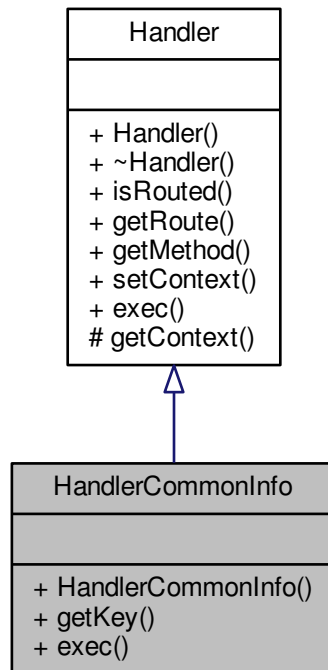

- /home/a\_krava/projects/progbase3/web\_server/main.cpp

## 4.14 HandlerCommonInfo Class Reference

Inheritance diagram for HandlerCommonInfo:

Collaboration diagram for HandlerCommonInfo:

## Public Member Functions

- [HandlerCommonInfo](#) (const char \*key\_in\_db, const char \*ds, [HTTP::Method](#) m)
- const char \* [getKey](#) ()
- void [exec](#) ()

## Additional Inherited Members

### 4.14.1 Constructor & Destructor Documentation

#### 4.14.1.1 HandlerCommonInfo()

```

HandlerCommonInfo::HandlerCommonInfo (
    const char * key_in_db,
    const char * ds,
    HTTP::Method m ) [inline]
  
```

## 4.14.2 Member Function Documentation

### 4.14.2.1 exec()

```
void HandlerCommonInfo::exec ( ) [inline], [virtual]
```

this method will be executed on every request (or uri path if set)

Implements [Handler](#).

### 4.14.2.2 getKey()

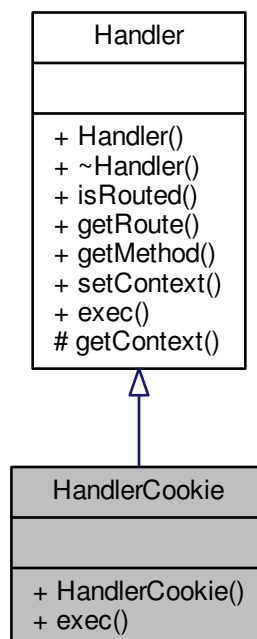

```
const char* HandlerCommonInfo::getKey ( ) [inline]
```

The documentation for this class was generated from the following file:

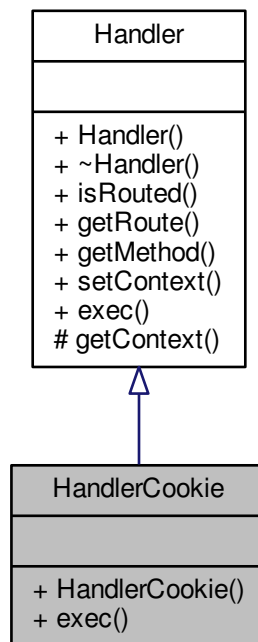

- [/home/a\\_krava/projects/progbase3/web\\_server/main.cpp](#)

## 4.15 HandlerCookie Class Reference

Inheritance diagram for HandlerCookie:

Collaboration diagram for HandlerCookie:

### Public Member Functions

- [HandlerCookie](#) ()
- void [exec](#) ()

### Additional Inherited Members

#### 4.15.1 Constructor & Destructor Documentation

##### 4.15.1.1 HandlerCookie()

```
HandlerCookie::HandlerCookie ( ) [inline]
```

#### 4.15.2 Member Function Documentation

## 4.15.2.1 exec()

```
void HandlerCookie::exec ( ) [inline], [virtual]
```

this method will be executed on every request (or uri path if set)

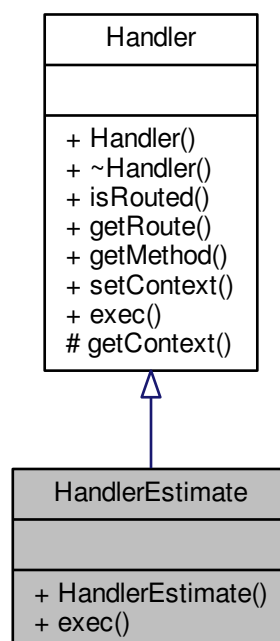

Implements [Handler](#).

The documentation for this class was generated from the following file:

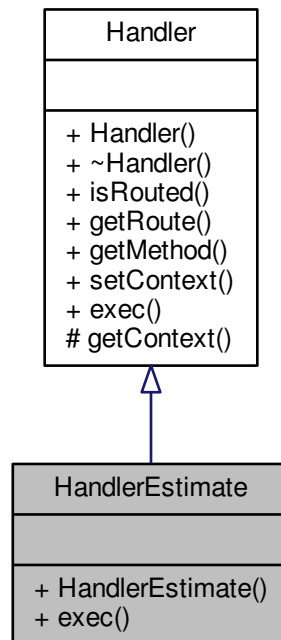

- /home/a\_krava/projects/progbase3/web\_server/[main.cpp](#)

## 4.16 HandlerEstimate Class Reference

Inheritance diagram for HandlerEstimate:

Collaboration diagram for HandlerEstimate:

## Public Member Functions

- [HandlerEstimate](#) (const char \*ds, [HTTP::Method](#) m)
- void [exec](#) ()

## Additional Inherited Members

### 4.16.1 Constructor & Destructor Documentation

#### 4.16.1.1 HandlerEstimate()

```
HandlerEstimate::HandlerEstimate (
    const char * ds,
    HTTP::Method m ) [inline]
```

### 4.16.2 Member Function Documentation

## 4.16.2.1 exec()

```
void HandlerEstimate::exec ( ) [inline], [virtual]
```

this method will be executed on every request (or uri path if set)

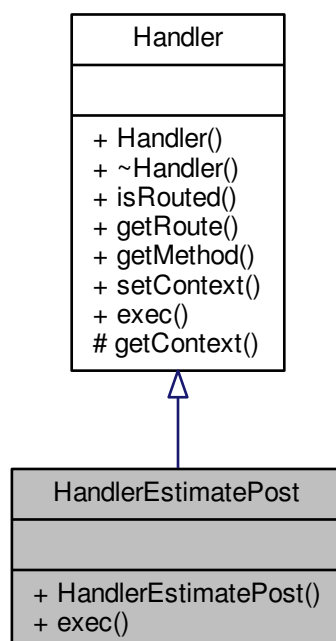

Implements [Handler](#).

The documentation for this class was generated from the following file:

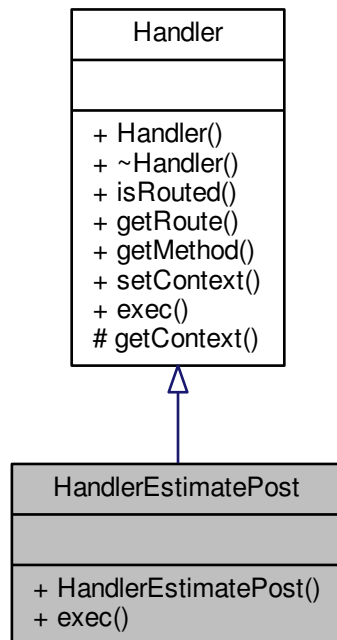

- /home/a\_krava/projects/progbase3/web\_server/[main.cpp](#)

## 4.17 HandlerEstimatePost Class Reference

Inheritance diagram for HandlerEstimatePost:

Collaboration diagram for HandlerEstimatePost:

## Public Member Functions

- [HandlerEstimatePost](#) (const char \*ds, [HTTP::Method](#) m)
- void [exec](#) ()

## Additional Inherited Members

### 4.17.1 Constructor & Destructor Documentation

#### 4.17.1.1 HandlerEstimatePost()

```

HandlerEstimatePost::HandlerEstimatePost (
    const char * ds,
    HTTP::Method m ) [inline]
  
```

### 4.17.2 Member Function Documentation

## 4.17.2.1 exec()

```
void HandlerEstimatePost::exec ( ) [inline], [virtual]
```

this method will be executed on every request (or uri path if set)

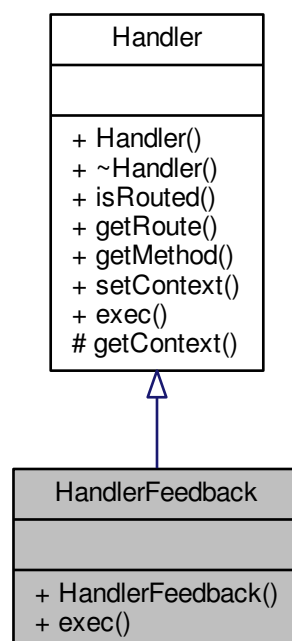

Implements [Handler](#).

The documentation for this class was generated from the following file:

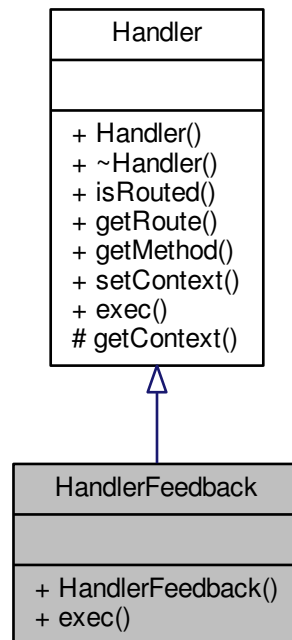

- /home/a\_krava/projects/progbase3/web\_server/[main.cpp](#)

## 4.18 HandlerFeedback Class Reference

Inheritance diagram for HandlerFeedback:

Collaboration diagram for HandlerFeedback:

## Public Member Functions

- [HandlerFeedback](#) (const char \*ds, [HTTP::Method](#) m)
- void [exec](#) ()

## Additional Inherited Members

### 4.18.1 Constructor & Destructor Documentation

#### 4.18.1.1 HandlerFeedback()

```

HandlerFeedback::HandlerFeedback (
    const char * ds,
    HTTP::Method m ) [inline]
  
```

### 4.18.2 Member Function Documentation

## 4.18.2.1 exec()

```
void HandlerFeedback::exec ( ) [inline], [virtual]
```

this method will be executed on every request (or uri path if set)

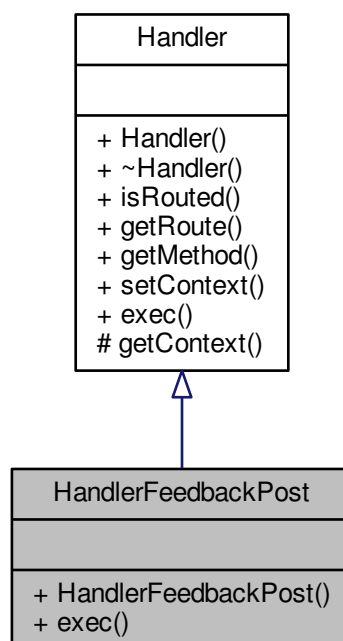

Implements [Handler](#).

The documentation for this class was generated from the following file:

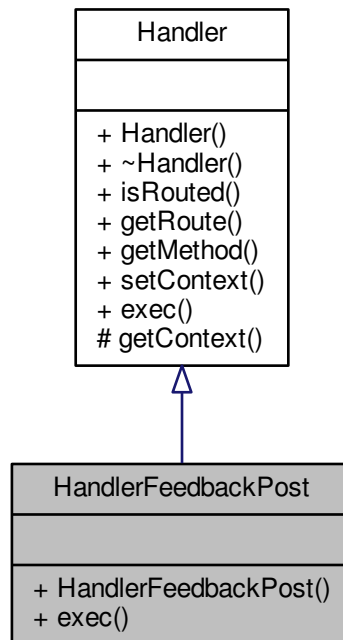

- /home/a\_krava/projects/progbase3/web\_server/main.cpp

## 4.19 HandlerFeedbackPost Class Reference

Inheritance diagram for HandlerFeedbackPost:

Collaboration diagram for HandlerFeedbackPost:

## Public Member Functions

- [HandlerFeedbackPost](#) (const char \*ds, [HTTP::Method](#) m)
- void [exec](#) ()

## Additional Inherited Members

### 4.19.1 Constructor & Destructor Documentation

#### 4.19.1.1 HandlerFeedbackPost()

```

HandlerFeedbackPost::HandlerFeedbackPost (
    const char * ds,
    HTTP::Method m ) [inline]
  
```

### 4.19.2 Member Function Documentation

## 4.19.2.1 exec()

```
void HandlerFeedbackPost::exec ( ) [inline], [virtual]
```

this method will be executed on every request (or uri path if set)

Implements [Handler](#).

The documentation for this class was generated from the following file:

- /home/a\_krava/projects/progbase3/web\_server/[main.cpp](#)

## 4.20 HandlerIndex Class Reference

Inheritance diagram for HandlerIndex:

Collaboration diagram for HandlerIndex:

## Public Member Functions

- [HandlerIndex](#) (const char \*ds, [HTTP::Method](#) m)
- void [exec](#) ()

## Additional Inherited Members

### 4.20.1 Constructor & Destructor Documentation

#### 4.20.1.1 HandlerIndex()

```
HandlerIndex::HandlerIndex (
    const char * ds,
    HTTP::Method m ) [inline]
```

### 4.20.2 Member Function Documentation

## 4.20.2.1 exec()

```
void HandlerIndex::exec ( ) [inline], [virtual]
```

this method will be executed on every request (or uri path if set)

Implements [Handler](#).

The documentation for this class was generated from the following file:

- /home/a\_krava/projects/progbase3/web\_server/[main.cpp](#)

## 4.21 HandlerMap Class Reference

Inheritance diagram for HandlerMap:

Collaboration diagram for HandlerMap:

## Public Member Functions

- [HandlerMap](#) (const char \*ds, [HTTP::Method](#) m)
- void [exec](#) ()

## Additional Inherited Members

### 4.21.1 Constructor & Destructor Documentation

#### 4.21.1.1 HandlerMap()

```

HandlerMap::HandlerMap (
    const char * ds,
    HTTP::Method m ) [inline]
  
```

### 4.21.2 Member Function Documentation

## 4.21.2.1 exec()

```
void HandlerMap::exec ( ) [inline], [virtual]
```

this method will be executed on every request (or uri path if set)

Implements [Handler](#).

The documentation for this class was generated from the following file:

- /home/a\_krava/projects/progbase3/web\_server/main.cpp

## 4.22 HandlerNews Class Reference

Inheritance diagram for HandlerNews:

Collaboration diagram for HandlerNews:

## Public Member Functions

- [HandlerNews](#) (const char \*ds, [HTTP::Method](#) m)
- void [exec](#) ()

## Additional Inherited Members

### 4.22.1 Constructor & Destructor Documentation

#### 4.22.1.1 HandlerNews()

```

HandlerNews::HandlerNews (
    const char * ds,
    HTTP::Method m ) [inline]
  
```

### 4.22.2 Member Function Documentation

## 4.22.2.1 exec()

```
void HandlerNews::exec ( ) [inline], [virtual]
```

this method will be executed on every request (or uri path if set)

Implements [Handler](#).

The documentation for this class was generated from the following file:

- /home/a\_krava/projects/progbase3/web\_server/main.cpp

## 4.23 HandlerOrder Class Reference

Inheritance diagram for HandlerOrder:

Collaboration diagram for HandlerOrder:

## Public Member Functions

- [HandlerOrder](#) (const char \*ds, [HTTP::Method](#) m)
- void [exec](#) ()

## Additional Inherited Members

### 4.23.1 Constructor & Destructor Documentation

#### 4.23.1.1 HandlerOrder()

```

HandlerOrder::HandlerOrder (
    const char * ds,
    HTTP::Method m ) [inline]
  
```

### 4.23.2 Member Function Documentation

## 4.23.2.1 exec()

```
void HandlerOrder::exec ( ) [inline], [virtual]
```

this method will be executed on every request (or uri path if set)

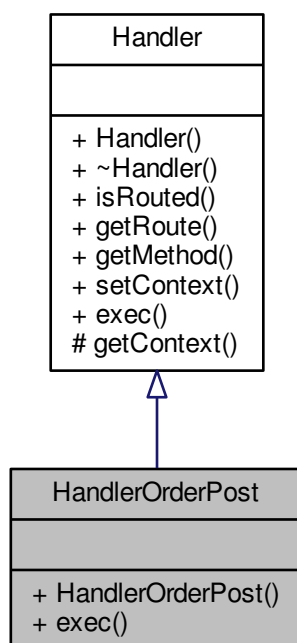

Implements [Handler](#).

The documentation for this class was generated from the following file:

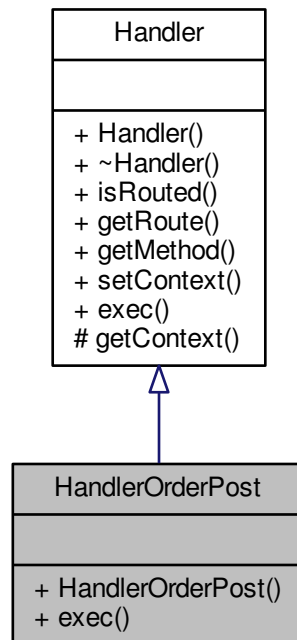

- /home/a\_krava/projects/progbase3/web\_server/[main.cpp](#)

## 4.24 HandlerOrderPost Class Reference

Inheritance diagram for HandlerOrderPost:

Collaboration diagram for HandlerOrderPost:

## Public Member Functions

- [HandlerOrderPost](#) (const char \*ds, [HTTP::Method](#) m)
- void [exec](#) ()

## Additional Inherited Members

### 4.24.1 Constructor & Destructor Documentation

#### 4.24.1.1 HandlerOrderPost()

```

HandlerOrderPost::HandlerOrderPost (
    const char * ds,
    HTTP::Method m ) [inline]
  
```

### 4.24.2 Member Function Documentation

## 4.24.2.1 exec()

```
void HandlerOrderPost::exec ( ) [inline], [virtual]
```

this method will be executed on every request (or uri path if set)

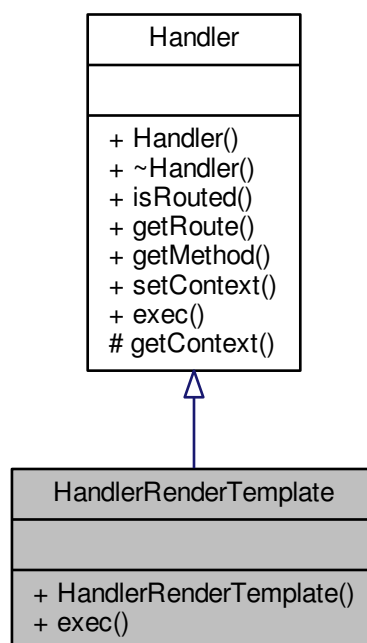

Implements [Handler](#).

The documentation for this class was generated from the following file:

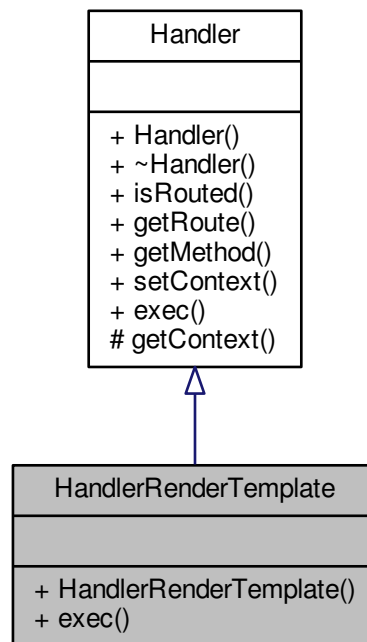

- /home/a\_krava/projects/progbase3/web\_server/[main.cpp](#)

## 4.25 HandlerRenderTemplate Class Reference

Inheritance diagram for HandlerRenderTemplate:

Collaboration diagram for HandlerRenderTemplate:

## Public Member Functions

- [HandlerRenderTemplate \(\)](#)
- void [exec \(\)](#)

## Additional Inherited Members

### 4.25.1 Constructor & Destructor Documentation

#### 4.25.1.1 HandlerRenderTemplate()

```
HandlerRenderTemplate::HandlerRenderTemplate ( ) [inline]
```

### 4.25.2 Member Function Documentation

## 4.25.2.1 exec()

```
void HandlerRenderTemplate::exec ( ) [inline], [virtual]
```

this method will be executed on every request (or uri path if set)

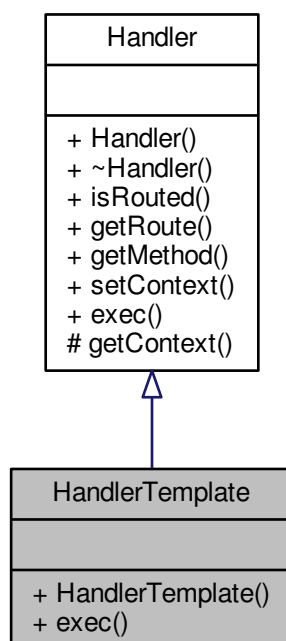

Implements [Handler](#).

The documentation for this class was generated from the following file:

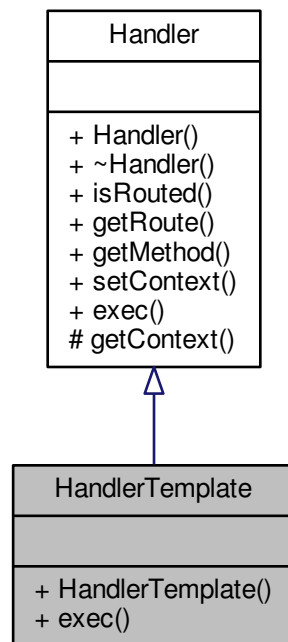

- /home/a\_krava/projects/progbase3/web\_server/[main.cpp](#)

## 4.26 HandlerTemplate Class Reference

Inheritance diagram for HandlerTemplate:

Collaboration diagram for HandlerTemplate:

## Public Member Functions

- [HandlerTemplate](#) ()
- void [exec](#) ()

## Additional Inherited Members

### 4.26.1 Constructor & Destructor Documentation

#### 4.26.1.1 HandlerTemplate()

```
HandlerTemplate::HandlerTemplate ( ) [inline]
```

### 4.26.2 Member Function Documentation

## 4.26.2.1 exec()

```
void HandlerTemplate::exec ( ) [inline], [virtual]
```

this method will be executed on every request (or uri path if set)

Implements [Handler](#).

The documentation for this class was generated from the following file:

- /home/a\_krava/projects/progbase3/web\_server/[main.cpp](#)

## 4.27 HandlerTrack Class Reference

Inheritance diagram for HandlerTrack:

Collaboration diagram for HandlerTrack:

## Public Member Functions

- `HandlerTrack` (const char \*ds, [HTTP::Method](#) m)
- void `exec` ()

## Additional Inherited Members

### 4.27.1 Constructor & Destructor Documentation

#### 4.27.1.1 HandlerTrack()

```
HandlerTrack::HandlerTrack (
    const char * ds,
    HTTP::Method m ) [inline]
```

### 4.27.2 Member Function Documentation

4.27.2.1 `exec()`

```
void HandlerTrack::exec ( ) [inline], [virtual]
```

this method will be executed on every request (or uri path if set)

Implements [Handler](#).

The documentation for this class was generated from the following file:

- `/home/a_krava/projects/progbase3/web_server/main.cpp`

## 4.28 Headers Class Reference

wrapper class for http headers

```
#include <headers.h>
```

Collaboration diagram for Headers:

### Public Member Functions

- [Headers](#) ()
- [~Headers](#) ()
- [Headers](#) (std::string &httpHeaders)
- std::string [toString](#) ()
- std::unordered\_map< std::string, std::string > [getHeaders](#) ()
- void [add](#) (const char \*key, const char \*value)
- bool [getValue](#) (const char \*key, std::string &value)

### 4.28.1 Detailed Description

wrapper class for http headers

[Headers](#) consist of map with key-value pairs, and is using for [Request](#) and [Response](#) http objects

### 4.28.2 Constructor & Destructor Documentation

#### 4.28.2.1 Headers() [1/2]

```
Headers::Headers ( )
```

create empty headers object

#### 4.28.2.2 ~Headers()

```
Headers::~Headers ( )
```

cleanup map of key-value pairs

#### 4.28.2.3 Headers() [2/2]

```
Headers::Headers (
    std::string & httpHeaders )
```

create [Headers](#), parsing http input string

#### Parameters

<i>httpHeaders</i>	input http headers string
--------------------	---------------------------

### 4.28.3 Member Function Documentation

#### 4.28.3.1 add()

```
void Headers::add (
    const char * key,
    const char * value )
```

insert value by key to map, if key exists, it will be overwritten

## Parameters

<i>key</i>	input key
<i>value</i>	input value

## 4.28.3.2 getHeaders()

```
unordered_map< string, string > Headers::getHeaders ( )
```

get current map

## Returns

map of key-value pairs

## 4.28.3.3 getValue()

```
bool Headers::getValue (
    const char * key,
    std::string & value )
```

get value from map by key

## Parameters

<i>key</i>	searched key
<i>value</i>	out param, if key exists, value will be written, nothing do otherwise

## Returns

true if value exists, false otherwise

## 4.28.3.4 toString()

```
std::string Headers::toString ( )
```

serialize [Headers](#) to string

## Returns

serialized string

The documentation for this class was generated from the following files:

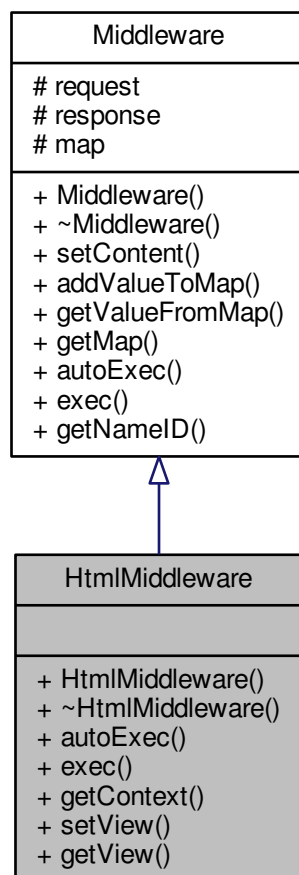

- [/home/a\\_krava/projects/progbase3/web\\_server/include/headers.h](#)
- [/home/a\\_krava/projects/progbase3/web\\_server/src/headers.cpp](#)

## 4.29 HtmlMiddleware Class Reference

inherited class to render html pages from templates

```
#include <html_middleware.h>
```

Inheritance diagram for HtmlMiddleware:

Collaboration diagram for HtmlMiddleware:

## Public Member Functions

- [HtmlMiddleware](#) (const char \*nameID)
- [~HtmlMiddleware](#) ()
- bool [autoExec](#) ()
- void [exec](#) ()
- mstch::map \* [getContext](#) ()

- void [setView](#) (std::string &view)
- std::string [getView](#) ()

## Additional Inherited Members

### 4.29.1 Detailed Description

inherited class to render html pages from templates

[HtmlMiddleware](#) uses logic-less mustache templates to render html pages

### 4.29.2 Constructor & Destructor Documentation

#### 4.29.2.1 HtmlMiddleware()

```
HtmlMiddleware::HtmlMiddleware (
    const char * nameID )
```

create middleware

##### Parameters

<i>nameID</i>	name id
---------------	---------

#### 4.29.2.2 ~HtmlMiddleware()

```
HtmlMiddleware::~~HtmlMiddleware ( )
```

delete context map, used fot rendering

### 4.29.3 Member Function Documentation

#### 4.29.3.1 autoExec()

```
bool HtmlMiddleware::autoExec ( ) [virtual]
```

Cleanup context map

##### Returns

true, if ready to render

Implements [Middleware](#).

#### 4.29.3.2 exec()

```
void HtmlMiddleware::exec ( ) [virtual]
```

render template and set to response body

Implements [Middleware](#).

#### 4.29.3.3 getContext()

```
mstch::map * HtmlMiddleware::getContext ( )
```

get current context map

##### Returns

context map of template

#### 4.29.3.4 getView()

```
std::string HtmlMiddleware::getView ( )
```

get current template view

##### Returns

template view string

#### 4.29.3.5 setView()

```
void HtmlMiddleware::setView (
    std::string & view )
```

set new template view

##### Parameters

<i>view</i>	template view as string
-------------	-------------------------

The documentation for this class was generated from the following files:

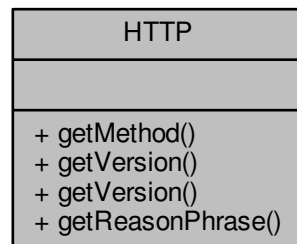

- [/home/a\\_krava/projects/progbase3/web\\_server/include/html\\_middleware.h](#)
- [/home/a\\_krava/projects/progbase3/web\\_server/src/html\\_middleware.cpp](#)

## 4.30 HTTP Class Reference

static class describes http method, version, and allow to convert it from/to string/enumeration

```
#include <http.h>
```

Collaboration diagram for HTTP:

### Public Types

- enum [Method](#) {  
[UNDEFINED](#), [GET](#), [HEAD](#), [POST](#),  
[PUT](#), [DELETE](#), [CONNECT](#), [OPTIONS](#),  
[TRACE](#), [PATCH](#), [ANY](#) }
- enum [Version](#) {  
[HTTP\\_UNDEFINED](#), [HTTP\\_0\\_9](#), [HTTP\\_1\\_0](#), [HTTP\\_1\\_1](#),  
[HTTP\\_2\\_0](#), [HTTP\\_ANY](#) }

### Static Public Member Functions

- static [HTTP::Method](#) [getMethod](#) (std::string &str)
- static [HTTP::Version](#) [getVersion](#) (std::string &str)
- static std::string [getVersion](#) ([HTTP::Version](#) version)
- static std::string [getReasonPhrase](#) (int code)

### 4.30.1 Detailed Description

static class describes http method, version, and allow to convert it from/to string/enumeration

[HTTP](#) class describes Method, Version, ReasonPhrase of code in http

### 4.30.2 Member Enumeration Documentation

#### 4.30.2.1 Method

```
enum HTTP::Method
```

Flags to define combinations of [HTTP Request](#) methods

## Enumerator

UNDEFINED	
GET	
HEAD	
POST	
PUT	
DELETE	
CONNECT	
OPTIONS	
TRACE	
PATCH	
ANY	

## 4.30.2.2 Version

```
enum HTTP::Version
```

Flags to define combinations of [HTTP](#) Version

## Enumerator

HTTP_UNDEFINED	
HTTP_0_9	
HTTP_1_0	
HTTP_1_1	
HTTP_2_0	
HTTP_ANY	

## 4.30.3 Member Function Documentation

4.30.3.1 `getMethod()`

```
HTTP::Method HTTP::getMethod (
    std::string & str ) [static]
```

Parse input string to http method

## Parameters

<i>str</i>	input string
------------	--------------

**Returns**

parsed method from string, if string wasn't valid returns UNDEFINED

**4.30.3.2 `getReasonPhrase()`**

```
std::string HTTP::getReasonPhrase (
    int code ) [static]
```

Serialize status code to string

**Parameters**

<i>code</i>	http status code
-------------	------------------

**Returns**

reason phrase for code as string, returns Not Found if code not found among values

**4.30.3.3 `getVersion()`** [1/2]

```
HTTP::Version HTTP::getVersion (
    std::string & str ) [static]
```

Parse input string to http version

**Parameters**

<i>str</i>	input string
------------	--------------

**Returns**

parsed version from string, if string wasn't valid returns HTTP\_UNDEFINED

**4.30.3.4 `getVersion()`** [2/2]

```
std::string HTTP::getVersion (
    HTTP::Version version ) [static]
```

Serialize [HTTP::Version](#) to string

## Parameters

<i>version</i>	http version
----------------	--------------

## Returns

version as string

The documentation for this class was generated from the following files:

- [/home/a\\_krava/projects/progbase3/web\\_server/include/http.h](#)
- [/home/a\\_krava/projects/progbase3/web\\_server/src/http.cpp](#)

## 4.31 InitParams Class Reference

[InitParams](#) is intended to get web-server configs from command line arguments.

```
#include <init_params.h>
```

Collaboration diagram for InitParams:

### Public Member Functions

- [InitParams](#) ()
- [InitParams](#) (int argc, char \*\*argv)
- bool [isIPv6](#) ()
- const char \* [getIP](#) ()
- int [getPort](#) ()
- std::string [getFilePath](#) ()

### 4.31.1 Detailed Description

[InitParams](#) is intended to get web-server configs from command line arguments.

This class make verification of ip-address, port etc...

### 4.31.2 Constructor & Destructor Documentation

#### 4.31.2.1 InitParams() [1/2]

```
InitParams::InitParams ( )
```

Create empty object

#### 4.31.2.2 InitParams() [2/2]

```
InitParams::InitParams (
    int argc,
    char ** argv )
```

Get params from command line arguments

##### Parameters

<i>argc</i>	num of params
<i>argv</i>	params

### 4.31.3 Member Function Documentation

#### 4.31.3.1 getFilePath()

```
std::string InitParams::getFilePath ( )
```

get log file path

##### Returns

log file path

#### 4.31.3.2 getIP()

```
const char * InitParams::getIP ( )
```

get ip address

##### Returns

ip host address

#### 4.31.3.3 getPort()

```
int InitParams::getPort ( )
```

get port

##### Returns

host post

#### 4.31.3.4 isIPv6()

```
bool InitParams::isIPv6 ( )
```

check if ip address is IPv6

##### Returns

true if ip address is IPv6, false otherwise

The documentation for this class was generated from the following files:

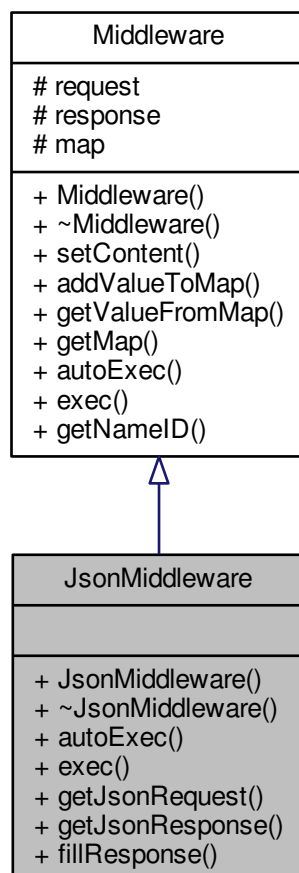

- [/home/a\\_krava/projects/progbase3/web\\_server/include/init\\_params.h](#)
- [/home/a\\_krava/projects/progbase3/web\\_server/src/init\\_params.cpp](#)

## 4.32 JsonMiddleware Class Reference

inherited class to perform any actions with json data

```
#include <json_middleware.h>
```

Inheritance diagram for JsonMiddleware:

Collaboration diagram for JsonMiddleware:

## Public Member Functions

- [JsonMiddleware](#) (const char \*nameID)
- [~JsonMiddleware](#) ()
- bool [autoExec](#) ()
- void [exec](#) ()
- nlhmann::json \* [getJsonRequest](#) ()

- nlohmann::json \* [getJSONResponse](#) ()
- void [fillResponse](#) ()

## Additional Inherited Members

### 4.32.1 Detailed Description

inherited class to perform any actions with json data

[JsonMiddleware](#) is intended to parse json from http request, fill response with json and perform any actions with json

### 4.32.2 Constructor & Destructor Documentation

#### 4.32.2.1 JsonMiddleware()

```
JsonMiddleware::JsonMiddleware (
    const char * nameID )
```

create middleware

#### Parameters

<i>nameID</i>	name id
---------------	---------

#### 4.32.2.2 ~JsonMiddleware()

```
JsonMiddleware::~~JsonMiddleware ( )
```

delete json request and response objects

### 4.32.3 Member Function Documentation

#### 4.32.3.1 autoExec()

```
bool JsonMiddleware::autoExec ( ) [virtual]
```

Check if request is json data

#### Returns

true, if content type of http request is json

Implements [Middleware](#).

#### 4.32.3.2 exec()

```
void JsonMiddleware::exec ( ) [virtual]
```

parse json from http request

Implements [Middleware](#).

#### 4.32.3.3 fillResponse()

```
void JsonMiddleware::fillResponse ( )
```

set response body with serialized json data from jsonResponse

#### 4.32.3.4 getJsonRequest()

```
nlohmann::json * JsonMiddleware::getJsonRequest ( )
```

get json request object

##### Returns

json request object

#### 4.32.3.5 getJsonResponse()

```
nlohmann::json * JsonMiddleware::getJsonResponse ( )
```

get json response object

##### Returns

json response object

The documentation for this class was generated from the following files:

- [/home/a\\_krava/projects/progbase3/web\\_server/include/json\\_middleware.h](#)
- [/home/a\\_krava/projects/progbase3/web\\_server/src/json\\_middleware.cpp](#)

### 4.33 LogManager Class Reference

logging info into file

```
#include <log_manager.h>
```

Collaboration diagram for LogManager:

#### Public Member Functions

- [LogManager](#) (const char \*fileName)
- void [operator<<](#) (const char \*data)
- void [operator<<](#) (std::string data)

#### 4.33.1 Detailed Description

logging info into file

[LogManager](#) create file and append it with input data data

#### 4.33.2 Constructor & Destructor Documentation

##### 4.33.2.1 LogManager()

```
LogManager::LogManager (
    const char * fileName )
```

create log file, if fileName is null no data will be written

#### Parameters

<i>fileName</i>	path to file (could be null)
-----------------	------------------------------

### 4.33.3 Member Function Documentation

#### 4.33.3.1 operator<<() [1/2]

```
void LogManager::operator<< (
    const char * data )
```

append to log new info

##### Parameters

<i>data</i>	logging information
-------------	---------------------

#### 4.33.3.2 operator<<() [2/2]

```
void LogManager::operator<< (
    std::string data )
```

append to log new info

##### Parameters

<i>data</i>	logging information
-------------	---------------------

The documentation for this class was generated from the following files:

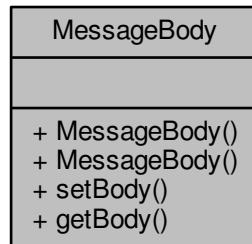

- [/home/a\\_krava/projects/progbase3/web\\_server/include/log\\_manager.h](#)
- [/home/a\\_krava/projects/progbase3/web\\_server/src/log\\_manager.cpp](#)

## 4.34 MessageBody Class Reference

wrapper class for http body

```
#include <message_body.h>
```

Collaboration diagram for `MessageBody`:

## Public Member Functions

- [MessageBody](#) ()
- [MessageBody](#) (std::string &body)
- void [setBody](#) (std::string &body)
- std::string [getBody](#) ()

### 4.34.1 Detailed Description

wrapper class for http body

[MessageBody](#) contains decoded information about http body

### 4.34.2 Constructor & Destructor Documentation

#### 4.34.2.1 MessageBody() [1/2]

```
MessageBody::MessageBody ( )
```

Create empty http body

#### 4.34.2.2 MessageBody() [2/2]

```
MessageBody::MessageBody (
    std::string & body )
```

Create http body from input string

## Parameters

<i>body</i>	input string
-------------	--------------

### 4.34.3 Member Function Documentation

#### 4.34.3.1 `getBody()`

```
std::string MessageBody::getBody ( )
```

get http body as string

## Returns

http body

#### 4.34.3.2 `setBody()`

```
void MessageBody::setBody (
    std::string & body )
```

set http body as string

## Parameters

<i>body</i>	http body
-------------	-----------

The documentation for this class was generated from the following files:

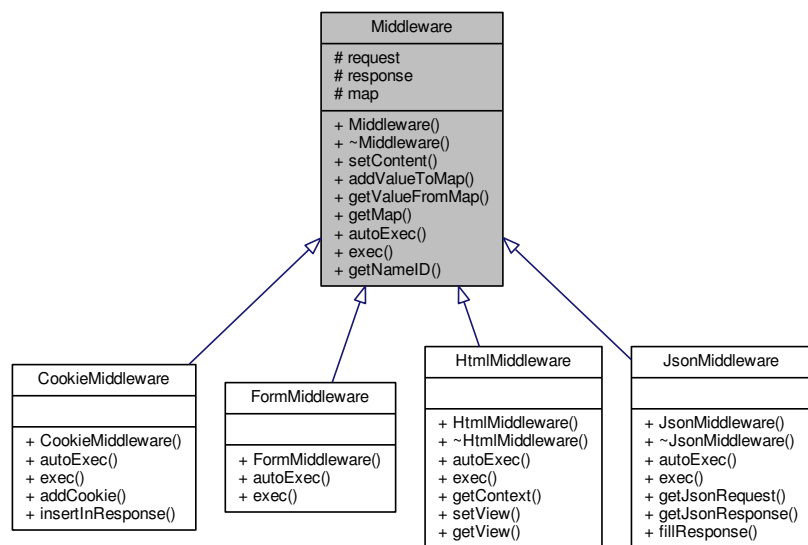

- [/home/a\\_krava/projects/progbase3/web\\_server/include/message\\_body.h](#)
- [/home/a\\_krava/projects/progbase3/web\\_server/src/message\\_body.cpp](#)

## 4.35 Middleware Class Reference

class wrapper for middleware

```
#include <middleware.h>
```

Inheritance diagram for Middleware:

Collaboration diagram for Middleware:

## Public Member Functions

- [Middleware](#) (const char \*nameID)
- virtual [~Middleware](#) ()
- void [setContent](#) ([Request](#) \*request, [Response](#) \*response)
- void [addValueToMap](#) (const char \*key, const char \*value)
- bool [getValueFromMap](#) (const char \*key, std::string &value)
- std::unordered\_map< std::string, std::string > \* [getMap](#) ()
- virtual bool [autoExec](#) ()=0
- virtual void [exec](#) ()=0
- std::string [getNameID](#) ()

## Protected Attributes

- [Request](#) \* request
- [Response](#) \* response
- std::unordered\_map< std::string, std::string > \* [map](#)

### 4.35.1 Detailed Description

class wrapper for middleware

[Middleware](#) have got current request and response objects and also map for key-value pairs. Method `exec` and `autoExec` can use request and response objects to perform actions.

### 4.35.2 Constructor & Destructor Documentation

#### 4.35.2.1 `Middleware()`

```
Middleware::Middleware (
    const char * nameID )
```

Create empty middleware, where [Request](#) and [Response](#) objects are null

##### Parameters

<i>nameID</i>	name id as string
---------------	-------------------

#### 4.35.2.2 `~Middleware()`

```
Middleware::~Middleware ( ) [virtual]
```

### 4.35.3 Member Function Documentation

#### 4.35.3.1 `addValueToMap()`

```
void Middleware::addValueToMap (
    const char * key,
    const char * value )
```

Add value to map by key. If key exists, it should be overwritten

##### Parameters

<i>key</i>	key as string
<i>value</i>	value as string

#### 4.35.3.2 autoExec()

```
virtual bool Middleware::autoExec ( ) [pure virtual]
```

Check if current request allow do exec method

##### Returns

true, if need do exec with current request, false otherwise

Implemented in [JsonMiddleware](#), [HtmlMiddleware](#), [CookieMiddleware](#), and [FormMiddleware](#).

#### 4.35.3.3 exec()

```
virtual void Middleware::exec ( ) [pure virtual]
```

perform operation with request and response objects

Implemented in [JsonMiddleware](#), [HtmlMiddleware](#), [CookieMiddleware](#), and [FormMiddleware](#).

#### 4.35.3.4 getMap()

```
unordered_map< string, string > * Middleware::getMap ( )
```

get map of key-value pairs

##### Returns

map of key-value pairs

#### 4.35.3.5 getNameID()

```
std::string Middleware::getNameID ( )
```

get name id of middleware

##### Returns

name id

#### 4.35.3.6 getValueFromMap()

```
bool Middleware::getValueFromMap (
    const char * key,
    std::string & value )
```

get value from map by key

**Parameters**

<i>key</i>	needed key
<i>value</i>	out param, if value exists should be written, do nothing otherwise

**Returns**

true if key exists in map, false otherwise

**4.35.3.7 setContent()**

```
void Middleware::setContent (
    Request * request,
    Response * response )
```

set request and response objects into [Middleware](#)

**Parameters**

<i>request</i>	request object
<i>response</i>	response object

**4.35.4 Member Data Documentation****4.35.4.1 map**

```
std::unordered_map<std::string, std::string>* Middleware::map [protected]
```

**4.35.4.2 request**

```
Request* Middleware::request [protected]
```

**4.35.4.3 response**

```
Response* Middleware::response [protected]
```

The documentation for this class was generated from the following files:

- [/home/a\\_krava/projects/progbase3/web\\_server/include/middleware.h](#)
- [/home/a\\_krava/projects/progbase3/web\\_server/src/middleware.cpp](#)

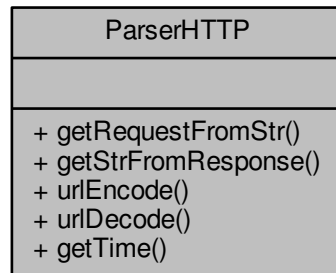

## 4.36 ParserHTTP Class Reference

static class for parsing, encoding, decoding any http data

```
#include <parser_http.h>
```

Collaboration diagram for ParserHTTP:

### Static Public Member Functions

- static [Request](#) \* [getRequestFromStr](#) (std::string &str)
- static std::string [getStrFromResponse](#) ([Response](#) &response)
- static std::string [urlEncode](#) (const std::string &value)
- static std::string [urlDecode](#) (const std::string &value)
- static std::string [getTime](#) (const time\_t \*time\_struct=nullptr, const char \*format="%Y.%m.%d")

#### 4.36.1 Detailed Description

static class for parsing, encoding, decoding any http data

[ParserHTTP](#) is used to serialize and deserialize http request, response etc.

#### 4.36.2 Member Function Documentation

##### 4.36.2.1 [getRequestFromStr\(\)](#)

```
Request * ParserHTTP::getRequestFromStr (
    std::string & str ) [static]
```

Deserialize http request from input string

**Parameters**

<i>str</i>	input string
------------	--------------

**Returns**

deserialized [Request](#) object

**4.36.2.2 getStrFromResponse()**

```
string ParserHTTP::getStrFromResponse (
    Response & response ) [static]
```

Serialize http response into string

**Parameters**

<i>response</i>	<a href="#">Response</a> object
-----------------	---------------------------------

**Returns**

serialized string

**4.36.2.3 getTime()**

```
std::string ParserHTTP::getTime (
    const time_t * time_struct = nullptr,
    const char * format = "%Y.%m.%d" ) [static]
```

get date stamp in string in format from time\_t

**Parameters**

<i>time_struct</i>	required time in time_t, if nullptr - execute current time
<i>format</i>	format of representing date in string

**Returns**

date stamp as string

## 4.36.2.4 urlDecode()

```
string ParserHTTP::urlDecode (
    const std::string & value ) [static]
```

Decode input string

## Parameters

<i>value</i>	input string
--------------	--------------

## Returns

decoded string

## 4.36.2.5 urlEncode()

```
string ParserHTTP::urlEncode (
    const std::string & value ) [static]
```

Encode input string

## Parameters

<i>value</i>	input string
--------------	--------------

## Returns

encoded string

The documentation for this class was generated from the following files:

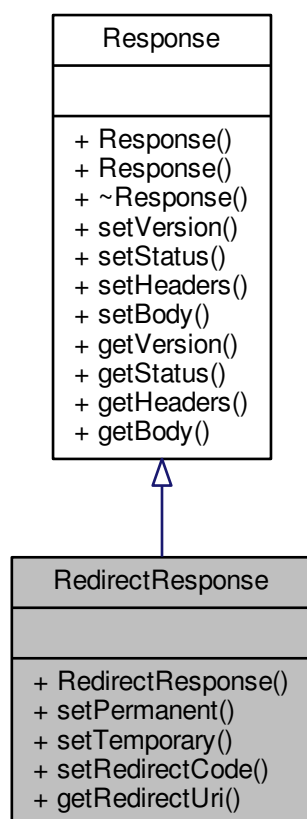

- [/home/a\\_krava/projects/progbase3/web\\_server/include/parser\\_http.h](#)
- [/home/a\\_krava/projects/progbase3/web\\_server/src/parser\\_http.cpp](#)

## 4.37 RedirectResponse Class Reference

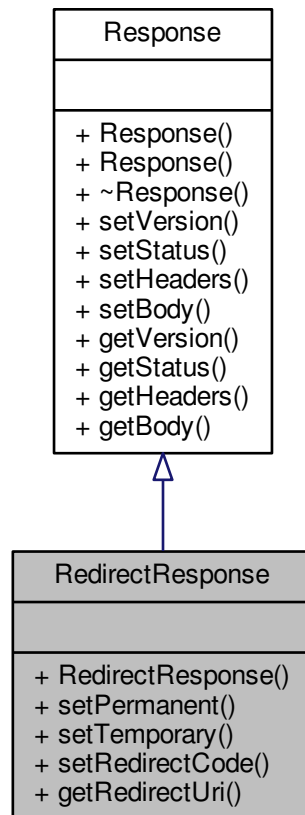

[Response](#) class which is intended to make http redirects.

```
#include <redirect_response.h>
```

Inheritance diagram for RedirectResponse:

Collaboration diagram for RedirectResponse:

### Public Member Functions

- [RedirectResponse](#) (const char \*redirectUri, const char \*targetUri)
- void [setPermanent](#) ()
- void [setTemporary](#) ()
- void [setRedirectCode](#) (int code)
- std::string [getRedirectUri](#) ()

#### 4.37.1 Detailed Description

[Response](#) class which is intended to make http redirects.

Inherited class [RedirectResponse](#) from [Response](#) for easiest adjusting redirects

#### 4.37.2 Constructor & Destructor Documentation

#### 4.37.2.1 RedirectResponse()

```
RedirectResponse::RedirectResponse (
    const char * redirectUri,
    const char * targetUri )
```

Create [RedirectResponse](#) object with redirect code 404 (you should use method to set required redirect code)

##### Parameters

<i>redirectUri</i>	input uri, which must be redirected
<i>targetUri</i>	destination redirect uri

### 4.37.3 Member Function Documentation

#### 4.37.3.1 getRedirectUri()

```
std::string RedirectResponse::getRedirectUri ( )
```

get target uri from redirect response

##### Returns

destination redirect uri

#### 4.37.3.2 setPermanent()

```
void RedirectResponse::setPermanent ( )
```

set permanent http redirect

#### 4.37.3.3 setRedirectCode()

```
void RedirectResponse::setRedirectCode (
    int code )
```

set redirect code status

##### Parameters

<i>code</i>	http redirect code status
-------------	---------------------------

## 4.37.3.4 setTemporary()

```
void RedirectResponse::setTemporary ( )
```

set temporary http redirect

The documentation for this class was generated from the following files:

- /home/a\_krava/projects/progbase3/web\_server/include/[redirect\\_response.h](#)
- /home/a\_krava/projects/progbase3/web\_server/src/[redirect\\_response.cpp](#)

## 4.38 Request Class Reference

class wrapper of [HTTP](#) request

```
#include <request.h>
```

Collaboration diagram for Request:

## Public Member Functions

- [Request](#) ()
- [Request](#) ([HTTP::Method](#) method, std::string &[URI](#), [HTTP::Version](#) version, std::string &headers, std::string &body)
- [~Request](#) ()
- [HTTP::Method](#) [getMethod](#) ()
- [URI](#) \* [getURI](#) ()
- [HTTP::Version](#) [getVersion](#) ()
- [Headers](#) \* [getHeaders](#) ()
- [MessageBody](#) \* [getMessageBody](#) ()

### 4.38.1 Detailed Description

class wrapper of [HTTP](#) request

Object of this class is deserialized http request, where all consisting data is represented by objects of another classes

### 4.38.2 Constructor & Destructor Documentation

#### 4.38.2.1 Request() [1/2]

```
Request::Request ( )
```

Makes empty [Request](#) object, where method and version is undefined

#### 4.38.2.2 Request() [2/2]

```
Request::Request (
    HTTP::Method method,
    std::string & URI,
    HTTP::Version version,
    std::string & headers,
    std::string & body )
```

Makes [Request](#) object with declared arguments

#### Parameters

<i>method</i>	http method of request
<i>URI</i>	http request uri string, which is used to construct <a href="#">URI</a> object
<i>version</i>	request http version
<i>headers</i>	http request headers string, which is used to construct <a href="#">Headers</a> object
<i>body</i>	http request body string, which is used to construct <a href="#">MessageBody</a> object

#### 4.38.2.3 ~Request()

```
Request::~Request ( )
```

deletes [URI](#), [Headers](#) and [MessageBody](#) objects

### 4.38.3 Member Function Documentation

#### 4.38.3.1 getHeaders()

`Headers * Request::getHeaders ( )`

get request headers

##### Returns

`Headers` request object

#### 4.38.3.2 getMessageBody()

`MessageBody * Request::getMessageBody ( )`

get request body

##### Returns

`MessageBody` request object

#### 4.38.3.3 getMethod()

`HTTP::Method Request::getMethod ( )`

get request method

##### Returns

value of enum `HTTP::Method`, which represents http method.

#### 4.38.3.4 getURI()

`URI * Request::getURI ( )`

get `URI` request object

##### Returns

request `URI` object

#### 4.38.3.5 getVersion()

```
HTTP::Version Request::getVersion ( )
```

get http version of request

##### Returns

value of enum [HTTP::Version](#), which represents http version.

The documentation for this class was generated from the following files:

- [/home/a\\_krava/projects/progbase3/web\\_server/include/request.h](#)
- [/home/a\\_krava/projects/progbase3/web\\_server/src/request.cpp](#)

## 4.39 Response Class Reference

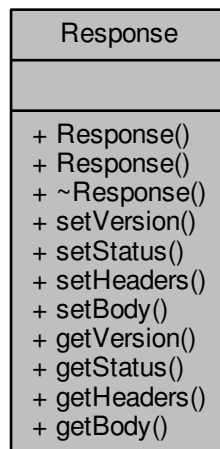

class wrapper of [HTTP](#) response

```
#include <response.h>
```

Inheritance diagram for Response:

Collaboration diagram for Response:

## Public Member Functions

- [Response](#) ()
- [Response](#) ([HTTP::Version](#) version, int status, [Headers](#) &headers, [MessageBody](#) &body)
- [~Response](#) ()
- void [setVersion](#) ([HTTP::Version](#) version)
- void [setStatus](#) (int status)
- void [setHeaders](#) ([Headers](#) &headers)
- void [setBody](#) ([MessageBody](#) &body)
- [HTTP::Version](#) [getVersion](#) ()
- int [getStatus](#) ()
- [Headers](#) \* [getHeaders](#) ()
- [MessageBody](#) \* [getBody](#) ()

### 4.39.1 Detailed Description

class wrapper of [HTTP](#) response

Object of this class is representation http response

### 4.39.2 Constructor & Destructor Documentation

#### 4.39.2.1 [Response](#)() [ 1 / 2 ]

`Response::Response ( )`

Create empty response with code status 501 and http version HTTP\_UNDEFINED

#### 4.39.2.2 Response() [2/2]

```
Response::Response (
    HTTP::Version version,
    int status,
    Headers & headers,
    MessageBody & body )
```

Create response and fill it with declared arguments

##### Parameters

<i>version</i>	http version of response
<i>status</i>	http response code status
<i>headers</i>	http response headers as <a href="#">Headers</a> object
<i>body</i>	http response body as <a href="#">MessageBody</a> object

#### 4.39.2.3 ~Response()

```
Response::~~Response ( )
```

deletes [Headers](#) and [MessageBody](#) objects

### 4.39.3 Member Function Documentation

#### 4.39.3.1 getBody()

```
MessageBody * Response::getBody ( )
```

get body of http response

##### Returns

http response body as [MessageBody](#) object

#### 4.39.3.2 getHeaders()

```
Headers * Response::getHeaders ( )
```

get headers of http response

##### Returns

http response headers as [Headers](#) object

#### 4.39.3.3 getStatus()

```
int Response::getStatus ( )
```

get http code status of response

##### Returns

http response code status

#### 4.39.3.4 getVersion()

```
HTTP::Version Response::getVersion ( )
```

get http version of response

##### Returns

http response version

#### 4.39.3.5 setBody()

```
void Response::setBody (
    MessageBody & body )
```

Set to response [MessageBody](#) object and deleting previous one

##### Parameters

<i>body</i>	<a href="#">MessageBody</a> object
-------------	------------------------------------

#### 4.39.3.6 setHeaders()

```
void Response::setHeaders (
    Headers & headers )
```

Set to response [Headers](#) object and deleting previous one

##### Parameters

<i>headers</i>	headers object
----------------	----------------

#### 4.39.3.7 setStatus()

```
void Response::setStatus (
    int status )
```

Set to response http status

##### Parameters

<i>status</i>	http code status
---------------	------------------

#### 4.39.3.8 setVersion()

```
void Response::setVersion (
    HTTP::Version version )
```

Set to response http version

##### Parameters

<i>version</i>	value of enum <a href="#">HTTP::Version</a> , which represents http version.
----------------	------------------------------------------------------------------------------

The documentation for this class was generated from the following files:

- [/home/a\\_krava/projects/progbase3/web\\_server/include/response.h](#)
- [/home/a\\_krava/projects/progbase3/web\\_server/src/response.cpp](#)

## 4.40 RuntimeException Class Reference

exception class for program errors

```
#include <runtime_exception.h>
```

Inheritance diagram for RuntimeException:

Collaboration diagram for RuntimeException:

### Public Member Functions

- [RuntimeException](#) (const std::string &error)
- const char \* [what](#) () const noexcept override

#### 4.40.1 Detailed Description

exception class for program errors

Inherited class from `std::exception`

## 4.40.2 Constructor & Destructor Documentation

### 4.40.2.1 RuntimeException()

```
RuntimeException::RuntimeException (
    const std::string & error ) [inline], [explicit]
```

create [RuntimeException](#) with error explanation

#### Parameters

<i>error</i>	explanation of thrown error
--------------	-----------------------------

## 4.40.3 Member Function Documentation

### 4.40.3.1 what()

```
const char* RuntimeException::what ( ) const [inline], [override], [noexcept]
```

get error information

#### Returns

error info as string

The documentation for this class was generated from the following file:

- [/home/a\\_krava/projects/progbase3/web\\_server/include/runtime\\_exception.h](#)

## 4.41 Socket Class Reference

wrapper functions to send/receive data via web-sockets

```
#include <socket.h>
```

Collaboration diagram for Socket:

## Public Member Functions

- [Socket](#) ([InitParams](#) params)
- [Socket](#) (std::string ip, int port, bool isIPv6)
- [~Socket](#) ()
- void [init](#) ()
- std::string [getData](#) ()
- void [receiveData](#) (std::string &data)
- std::string [toString](#) ()

### 4.41.1 Detailed Description

wrapper functions to send/receive data via web-sockets

Implementation of sockets function for Linux OS

### 4.41.2 Constructor & Destructor Documentation

#### 4.41.2.1 [Socket\(\)](#) [1/2]

```
Socket::Socket (
    InitParams params )
```

Filling object with host address information represented by [InitParams](#) object

#### Parameters

<i>params</i>	object of class <a href="#">InitParams</a> with info about host address
---------------	-------------------------------------------------------------------------

#### 4.41.2.2 Socket() [2/2]

```
Socket::Socket (
    std::string ip,
    int port,
    bool isIPv6 )
```

Filling object with host address information to do method init in future

##### Parameters

<i>ip</i>	host address ip as string (IPv4 or IPv6)
<i>port</i>	host address port
<i>isIPv6</i>	if argument ip is version 6 set true, false otherwise

#### 4.41.2.3 ~Socket()

```
Socket::~~Socket ( )
```

closing opened host socket

### 4.41.3 Member Function Documentation

#### 4.41.3.1 getData()

```
std::string Socket::getData ( )
```

Accepting all clients at configured host and reading data from current client

##### Exceptions

<a href="#"><i>RuntimeException</i></a>	when got error with reading from client
-----------------------------------------	-----------------------------------------

##### Returns

data as string

## 4.41.3.2 init()

```
void Socket::init ( )
```

create socket, binding created socket to host address and start listening port

## Exceptions

<a href="#">RuntimeException</a>	when address was invalid, busy etc.
----------------------------------	-------------------------------------

## 4.41.3.3 receiveData()

```
void Socket::receiveData (
    std::string & data )
```

receive data to client, which sent data before it (method getData was used)

## Parameters

<i>data</i>	serialized data into string
-------------	-----------------------------

## 4.41.3.4 toString()

```
std::string Socket::toString ( )
```

get information about current ip and port of host

## Returns

string in format "ip: xxx.xxx.xxx.xxx port: xx"

The documentation for this class was generated from the following files:

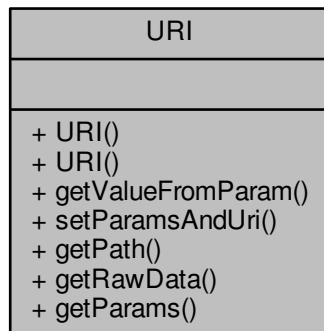

- /home/a\_krava/projects/progbase3/web\_server/include/[socket.h](#)
- /home/a\_krava/projects/progbase3/web\_server/src/[socket.cpp](#)

## 4.42 URI Class Reference

class represents http uri

```
#include <uri.h>
```

Collaboration diagram for URI:

## Public Member Functions

- [URI](#) ()
- [URI](#) (std::string &uri)
- bool [getValueFromParam](#) (const char \*key, std::string &value)
- void [setParamsAndUri](#) (std::string &uri)
- std::string [getPath](#) ()
- std::string [getRawData](#) ()
- std::unordered\_map< std::string, std::string > [getParams](#) ()

### 4.42.1 Detailed Description

class represents http uri

[URI](#) consist of uri - a string of uri without arguments, and map of key-value pairs which are deserialized parameters of uri

### 4.42.2 Constructor & Destructor Documentation

#### 4.42.2.1 [URI](#)() [1/2]

```
URI::URI ( )
```

Create empty [URI](#) object

#### 4.42.2.2 [URI](#)() [2/2]

```
URI::URI (
    std::string & uri )
```

Construct [URI](#) object from string, deserialize all params and decode input string

## Parameters

<i>uri</i>	http uri string
------------	-----------------

### 4.42.3 Member Function Documentation

#### 4.42.3.1 getParams()

```
unordered_map< string, string > URI::getParams ( )
```

get deserialized and decoded map of http uri params

## Returns

map of key-value pairs from uri params

#### 4.42.3.2 getPath()

```
string URI::getPath ( )
```

get decoded uri path without params

## Returns

http uri string without params

#### 4.42.3.3 getRawData()

```
std::string URI::getRawData ( )
```

get unchanged uri string with params

## Returns

http uri string

#### 4.42.3.4 getValueFromParam()

```
bool URI::getValueFromParam (
    const char * key,
    std::string & value )
```

get value by key from uri

**Parameters**

<i>key</i>	key in params of http uri
<i>value</i>	out param, where will be written value if exists or do nothing otherwise

**Returns**

true if key exists in map, false otherwise

**4.42.3.5 setParamsAndUri()**

```
void URI::setParamsAndUri (
    std::string & uri )
```

deserialize and decode input http uri into path and params

**Parameters**

<i>uri</i>	http uri string
------------	-----------------

The documentation for this class was generated from the following files:

- [/home/a\\_krava/projects/progbase3/web\\_server/include/uri.h](#)
- [/home/a\\_krava/projects/progbase3/web\\_server/src/uri.cpp](#)

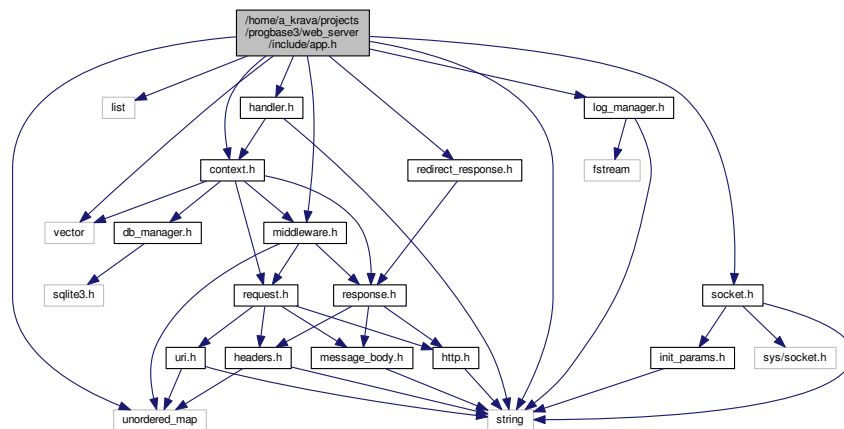

## Chapter 5

# File Documentation

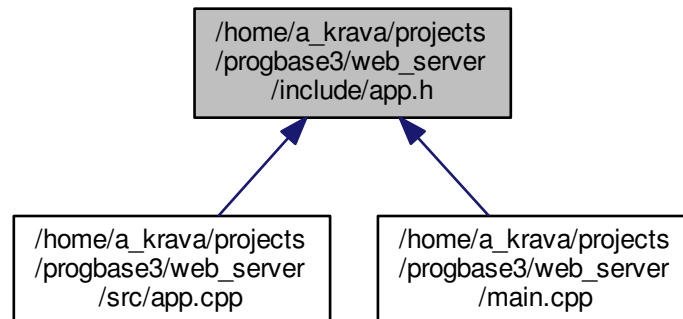

### 5.1 /home/a\_krava/projects/progbase3/web\_server/include/app.h File Reference

```
#include <string>
#include <list>
#include <vector>
#include <unordered_map>
#include <handler.h>
#include <socket.h>
#include <redirect_response.h>
#include <log_manager.h>
#include <middleware.h>
#include <context.h>
```

Include dependency graph for app.h:

This graph shows which files directly or indirectly include this file:

## Classes

- class [App](#)

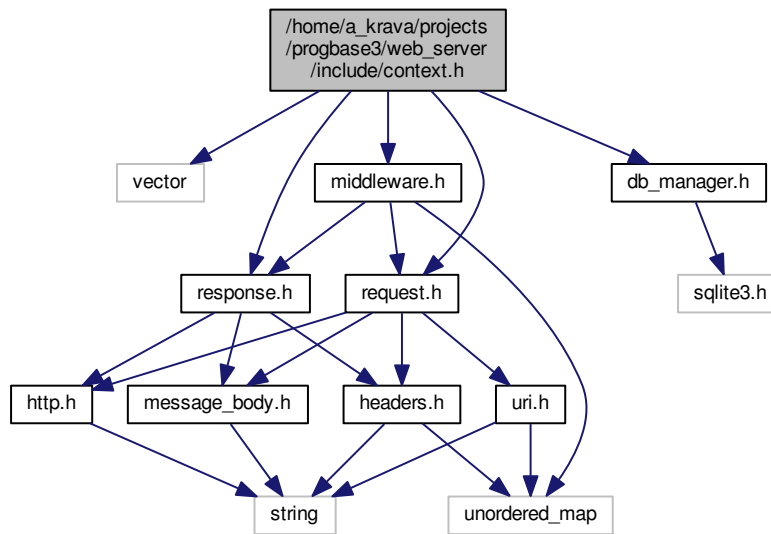

*The main class of the framework. Each object of this class is an independent web-application, which could be configured by handlers, middleware etc.*

## 5.2 /home/a\_krava/projects/progbase3/web\_server/include/context.h File Reference

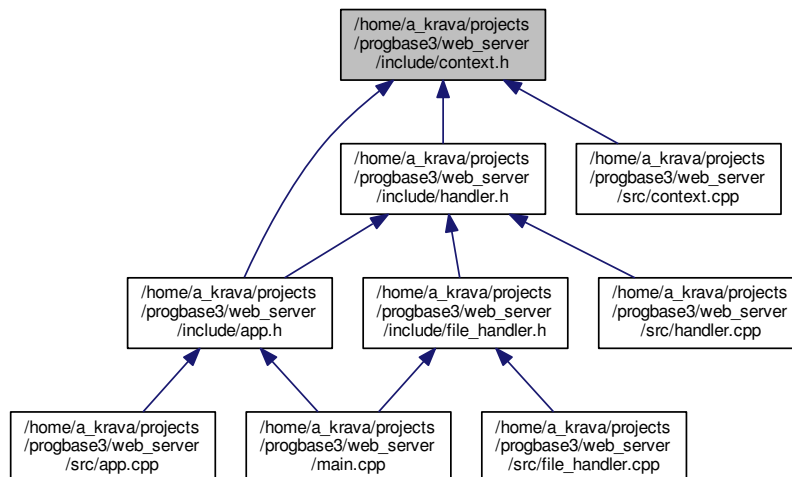

```
#include <vector>
#include <request.h>
#include <response.h>
#include <middleware.h>
#include <db_manager.h>
```

Include dependency graph for context.h:

This graph shows which files directly or indirectly include this file:

## Classes

- class [Context](#)

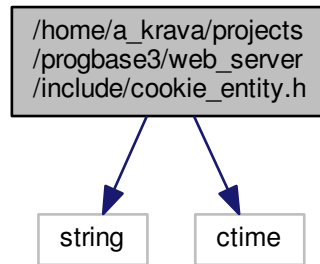

*This class is wrapper for important data (like [Response](#), [DB](#), [Middleware](#) etc.), which is needed to handlers.*

### 5.3 /home/a\_krava/projects/progbase3/web\_server/include/cookie\_entity.h File Reference

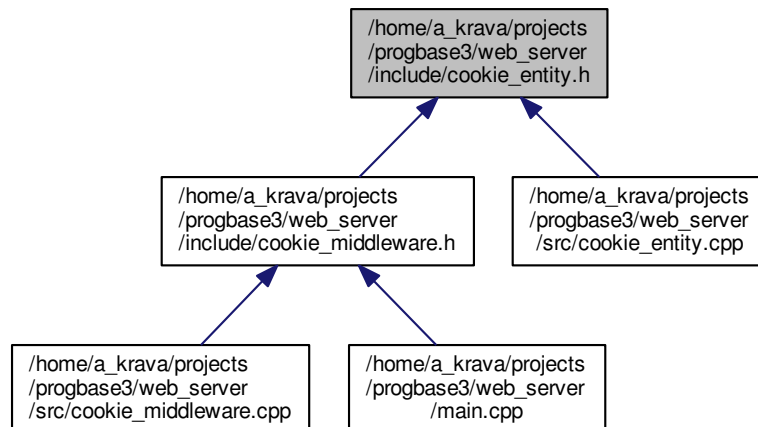

```
#include <string>
```

```
#include <ctime>
```

Include dependency graph for cookie\_entity.h:

This graph shows which files directly or indirectly include this file:

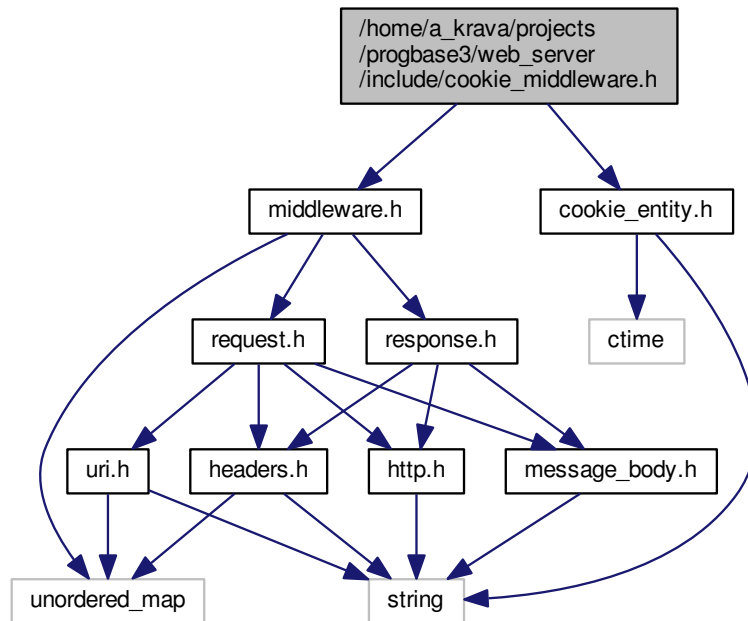

## Classes

- class [CookieEntity](#)

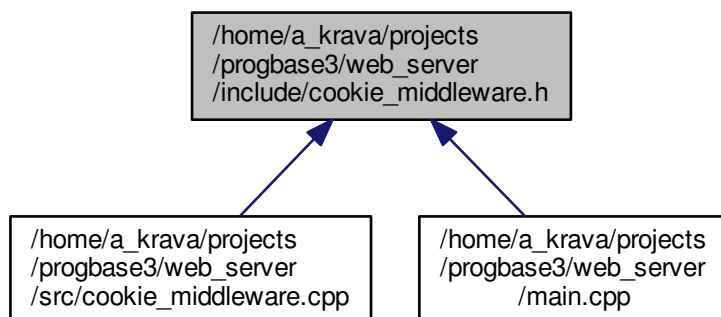

*Class wrapper for Cookies. Allow you adjust parameters of each http cookie. Used by [CookieMiddleware](#).*

## 5.4 /home/a\_krava/projects/progbase3/web\_server/include/cookie\_middleware.h File Reference

```
#include <middleware.h>
#include <cookie_entity.h>
Include dependency graph for cookie_middleware.h:
```

This graph shows which files directly or indirectly include this file:

## Classes

- class [CookieMiddleware](#)

*inherited class to parse cookie from http request*

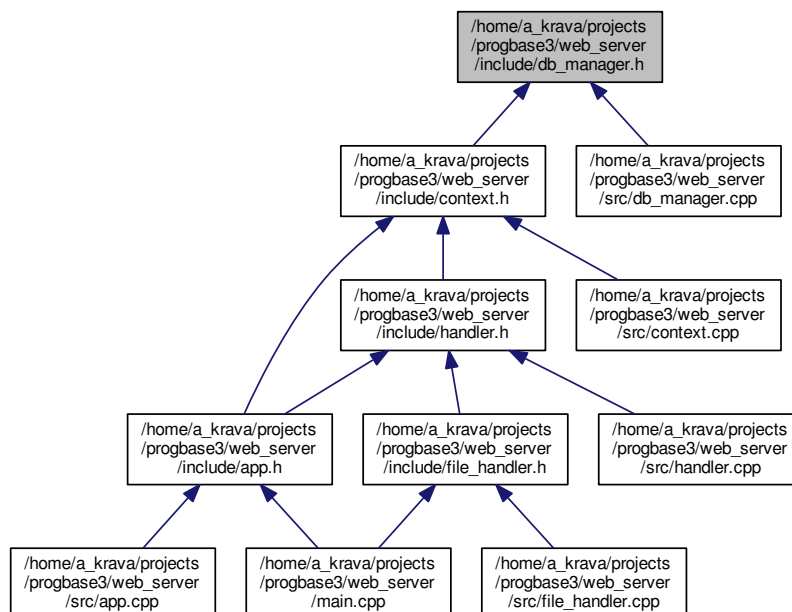

## 5.5 /home/a\_krava/projects/progbase3/web\_server/include/db\_manager.h File Reference

```
#include <sqlite3.h>
```

Include dependency graph for db\_manager.h:

This graph shows which files directly or indirectly include this file:

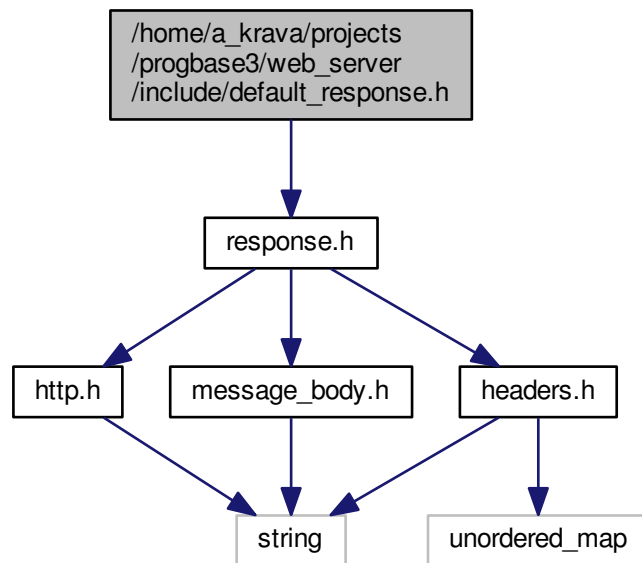

## Classes

- class [DBManager](#)  
*allow perform sql queries to db*

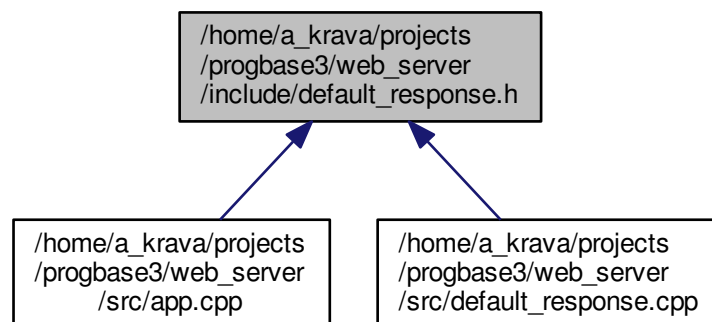

## 5.6 /home/a\_krava/projects/progbase3/web\_server/include/default\_response.h File Reference

```
#include <response.h>
```

Include dependency graph for default\_response.h:

This graph shows which files directly or indirectly include this file:

## Classes

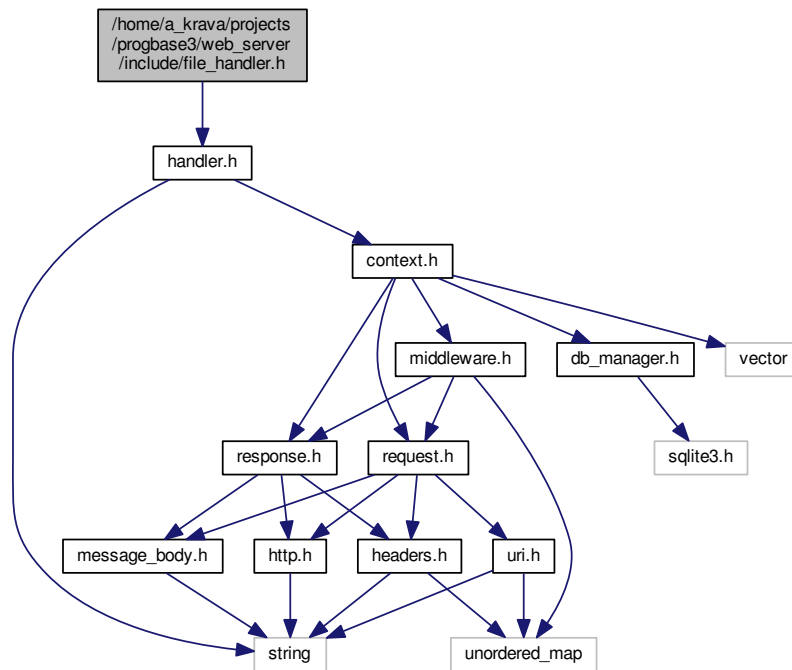

- class [DefaultResponse](#)

*[Response](#) class which is intended to make sample html pages on status codes.*

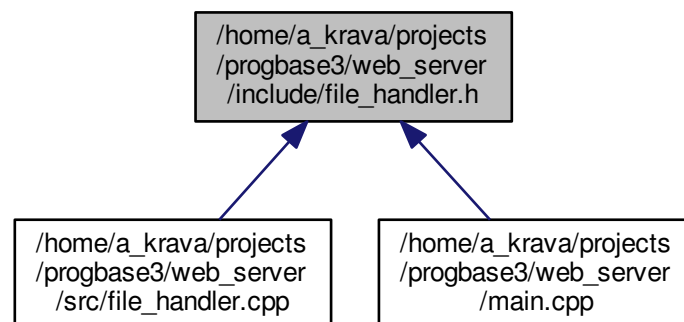

## 5.7 /home/a\_krava/projects/progbase3/web\_server/include/file\_handler.h File Reference

```
#include <handler.h>
```

Include dependency graph for file\_handler.h:

This graph shows which files directly or indirectly include this file:

## Classes

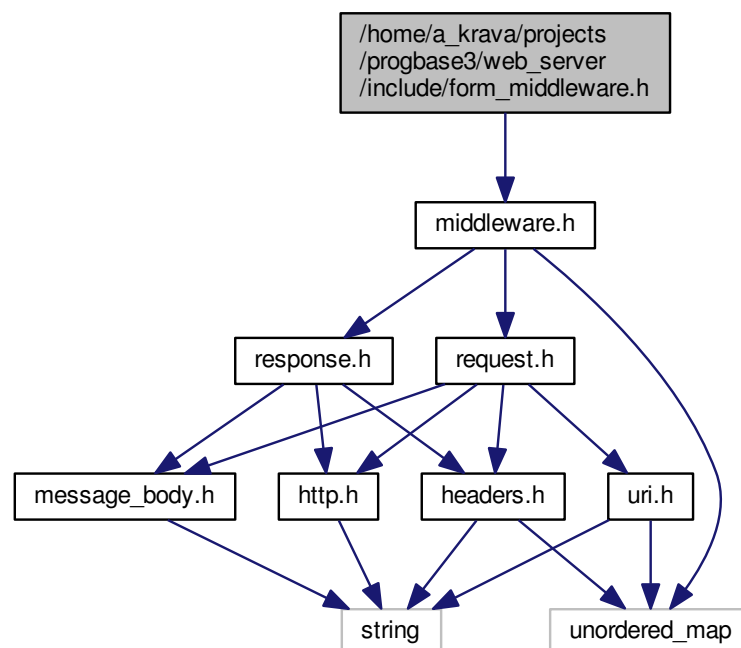

- class [FileHandler](#)

*this class allow you to set any file of filesystem as response body*

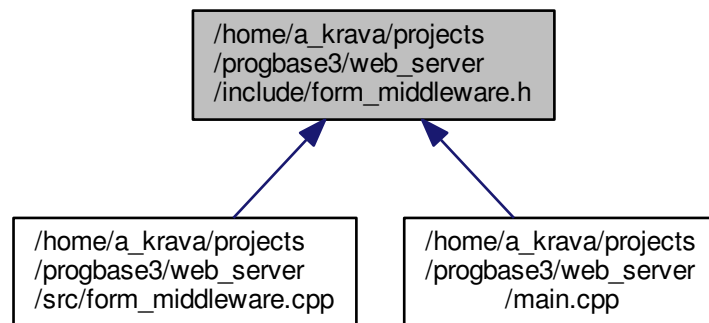

## 5.8 /home/a\_krava/projects/progbase3/web\_server/include/form\_middleware.h File Reference

```
#include <middleware.h>
```

Include dependency graph for form\_middleware.h:

This graph shows which files directly or indirectly include this file:

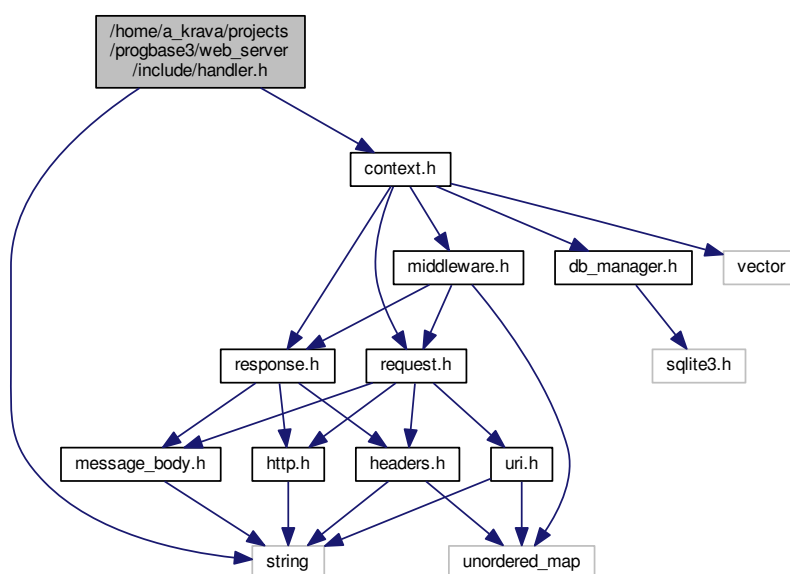

## Classes

- class [FormMiddleware](#)  
*inherited class to parse application/x-www-form-urlencoded*

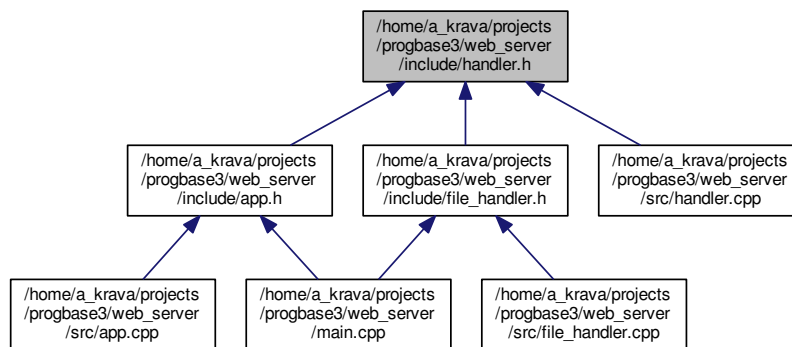

## 5.9 /home/a\_krava/projects/progbase3/web\_server/include/handler.h File Reference

```
#include <string>
#include <context.h>
Include dependency graph for handler.h:
```

This graph shows which files directly or indirectly include this file:

## Classes

- class [Handler](#)

*object of this class executes every time on new request, this object (and others) construct response to client*

## 5.10 /home/a\_krava/projects/progbase3/web\_server/include/headers.h File Reference

```
#include <string>
#include <unordered_map>
```

Include dependency graph for headers.h:

This graph shows which files directly or indirectly include this file:

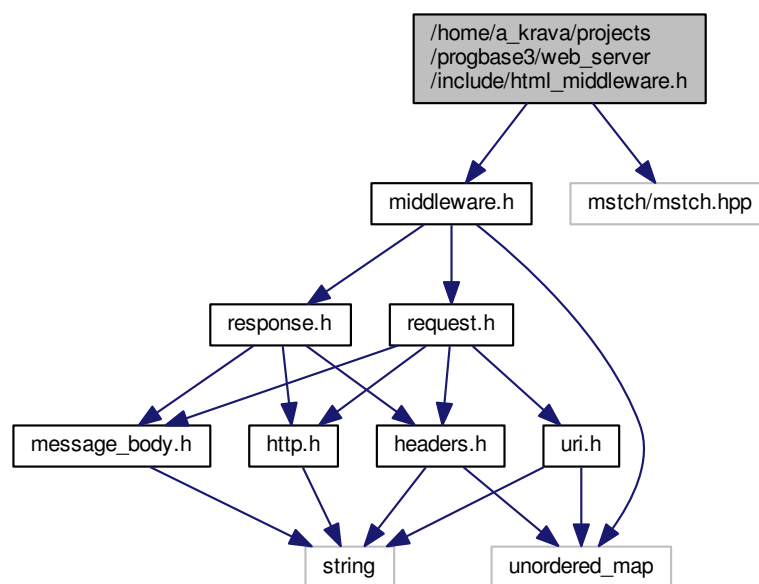

## Classes

- class [Headers](#)

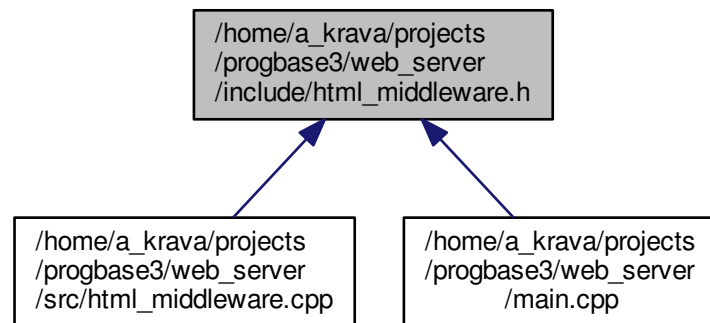

*wrapper class for http headers*

## 5.11 /home/a\_krava/projects/progbase3/web\_server/include/html\_middleware.h File Reference

```
#include <middleware.h>
#include <mstch/mstch.hpp>
Include dependency graph for html_middleware.h:
```

This graph shows which files directly or indirectly include this file:

## Classes

- class [HtmlMiddleware](#)

*inherited class to render html pages from templates*

## 5.12 /home/a\_krava/projects/progbase3/web\_server/include/http.h File Reference

```
#include <string>
```

Include dependency graph for http.h:

This graph shows which files directly or indirectly include this file:

## Classes

- class [HTTP](#)

*static class describes http method, version, and allow to convert it from/to string/enumeration*

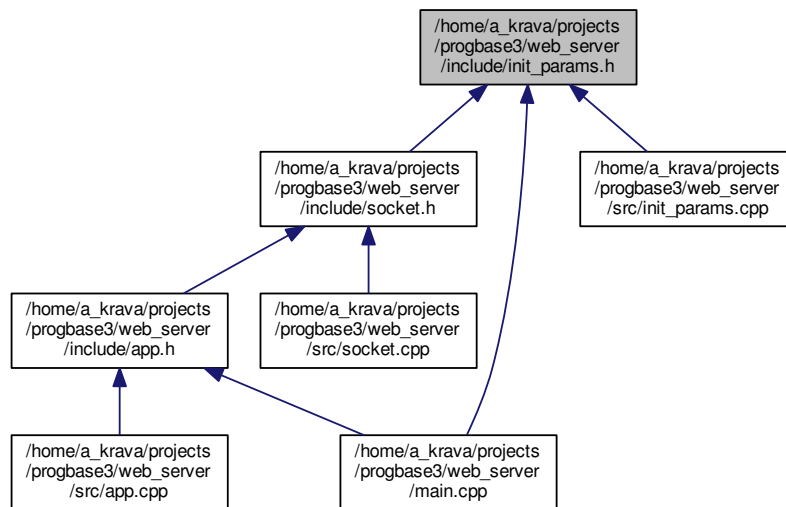

## 5.13 /home/a\_krava/projects/progbase3/web\_server/include/init\_params.h File Reference

```
#include <string>
```

Include dependency graph for init\_params.h:

This graph shows which files directly or indirectly include this file:

## Classes

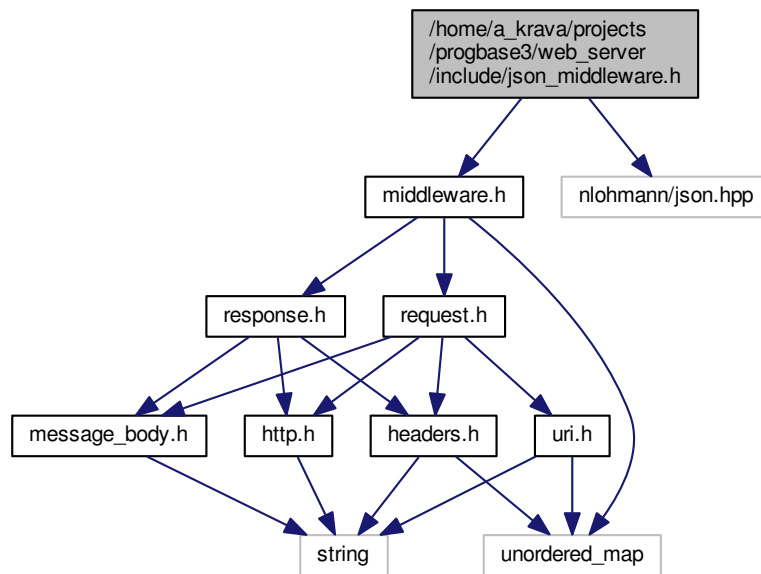

- class [InitParams](#)

*[InitParams](#) is intended to get web-server configs from command line arguments.*

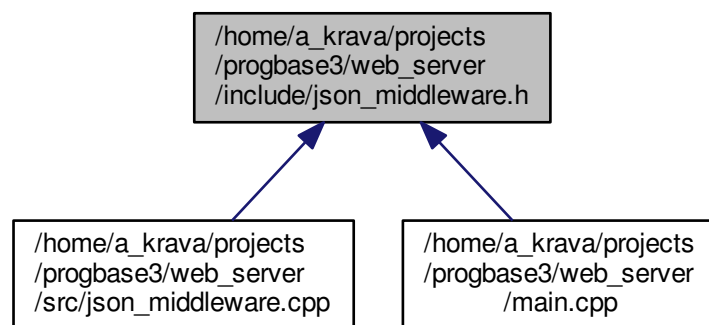

## 5.14 /home/a\_krava/projects/progbase3/web\_server/include/json\_middleware.h File Reference

```
#include <middleware.h>
#include <nlohmann/json.hpp>
```

Include dependency graph for json\_middleware.h:

This graph shows which files directly or indirectly include this file:

## Classes

- class [JsonMiddleware](#)

*inherited class to perform any actions with json data*

## 5.15 /home/a\_krava/projects/progbase3/web\_server/include/log\_manager.h File Reference

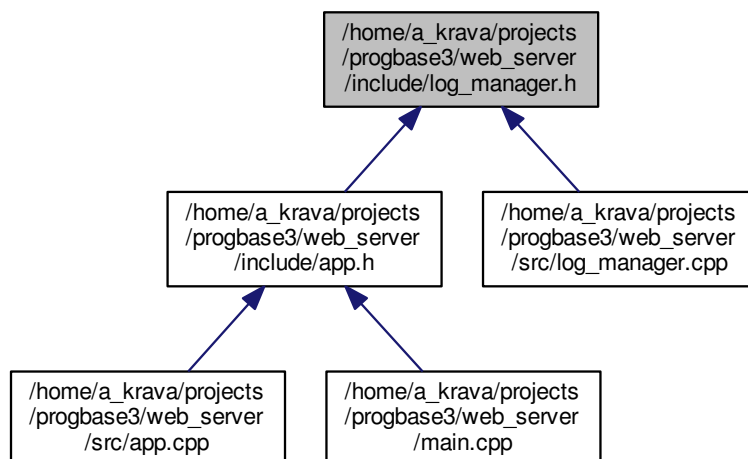

```
#include <string>
```

```
#include <fstream>
```

Include dependency graph for log\_manager.h:

This graph shows which files directly or indirectly include this file:

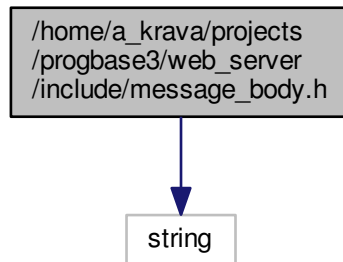

### Classes

- class [LogManager](#)  
*logging info into file*

## 5.16 /home/a\_krava/projects/progbase3/web\_server/include/message\_body.h File Reference

```
#include <string>
```

Include dependency graph for message\_body.h:

This graph shows which files directly or indirectly include this file:

## Classes

- class [MessageBody](#)  
*wrapper class for http body*

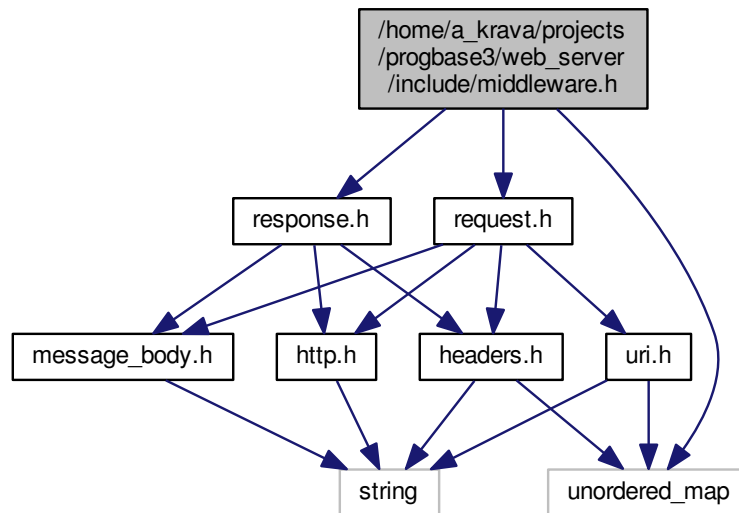

## 5.17 /home/a\_krava/projects/progbase3/web\_server/include/middleware.h File Reference

```
#include <response.h>
#include <unordered_map>
```

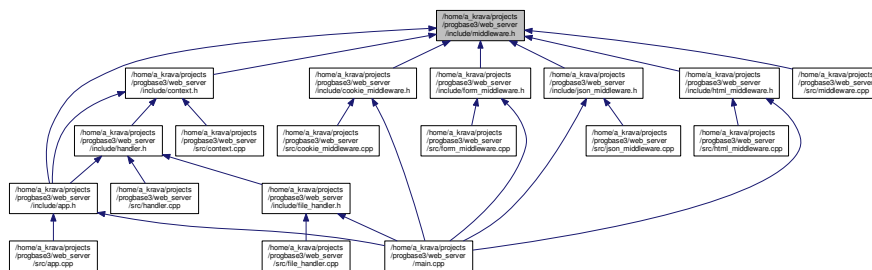

```
#include <request.h>
```

Include dependency graph for middleware.h:

This graph shows which files directly or indirectly include this file:

## Classes

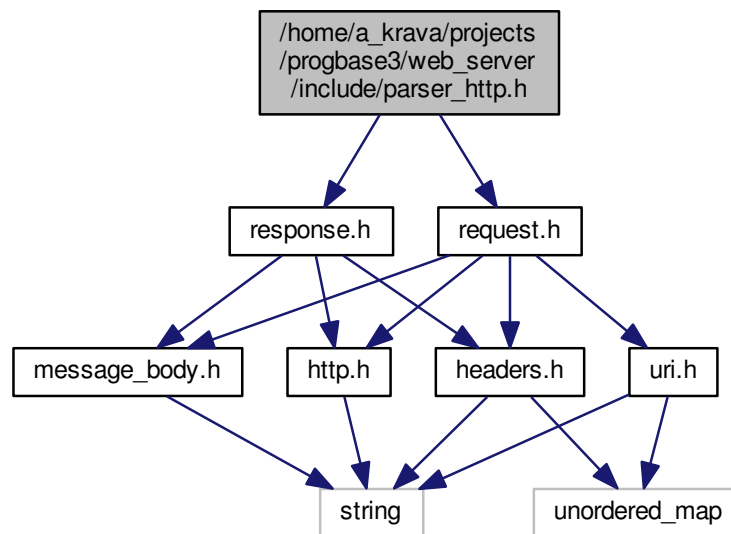

- class [Middleware](#)  
*class wrapper for middleware*

## 5.18 /home/a\_krava/projects/progbase3/web\_server/include/parser\_http.h File Reference

```
#include <request.h>
```

```
#include <response.h>
```

Include dependency graph for parser\_http.h:

This graph shows which files directly or indirectly include this file:

## Classes

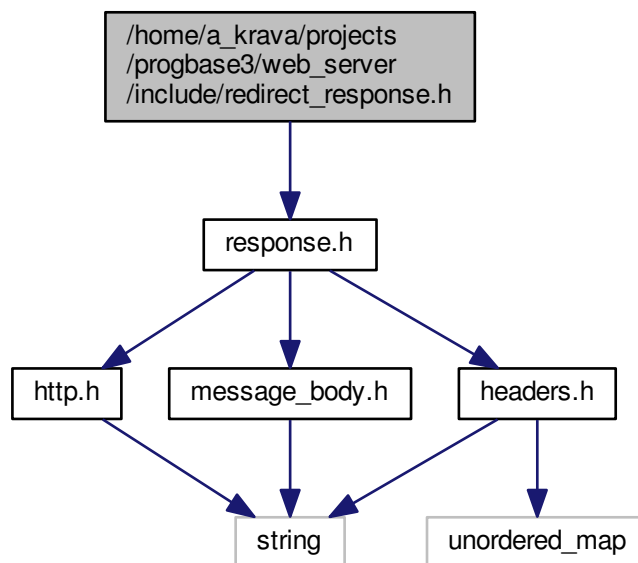

- class [ParserHTTP](#)

*static class for parsing, encoding, decoding any http data*

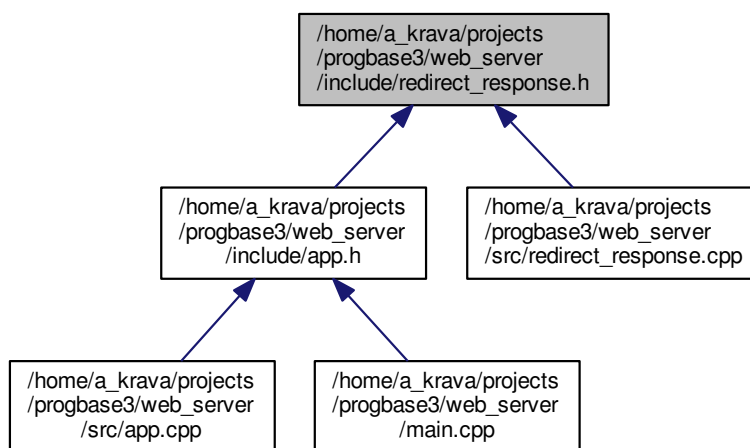

## 5.19 /home/a\_krava/projects/progbase3/web\_server/include/redirect\_response.h File Reference

```
#include <response.h>
```

Include dependency graph for redirect\_response.h:

This graph shows which files directly or indirectly include this file:

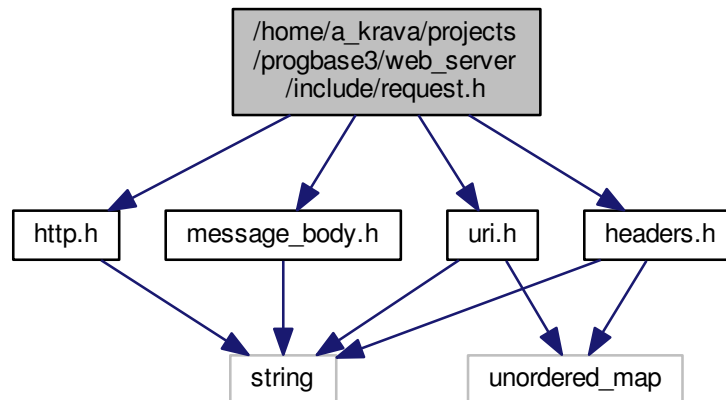

## Classes

- class [RedirectResponse](#)  
*Response class which is intended to make http redirects.*

## 5.20 /home/a\_krava/projects/progbase3/web\_server/include/request.h File Reference

```
#include <http.h>
#include <message_body.h>
#include <uri.h>
#include <headers.h>
```

Include dependency graph for request.h:

This graph shows which files directly or indirectly include this file:

### Classes

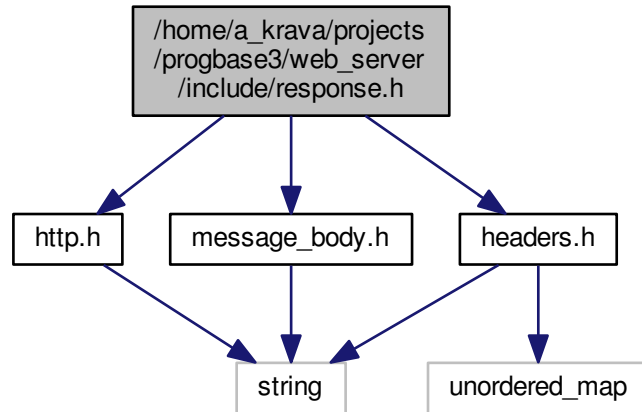

- class [Request](#)  
class wrapper of [HTTP](#) request

## 5.21 /home/a\_krava/projects/progbase3/web\_server/include/response.h File Reference

```
#include <http.h>
#include <headers.h>
```

```
#include <message_body.h>
```

Include dependency graph for response.h:

This graph shows which files directly or indirectly include this file:

## Classes

- class [Response](#)

*class wrapper of [HTTP](#) response*

## 5.22 /home/a\_krava/projects/progbase3/web\_server/include/runtime\_exception.h File Reference

```
#include <exception>
#include <string>
```

Include dependency graph for runtime\_exception.h:

This graph shows which files directly or indirectly include this file:

## Classes

- class [RuntimeException](#)

*exception class for program errors*

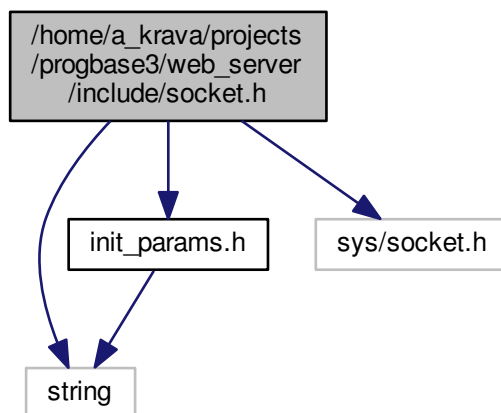

## 5.23 /home/a\_krava/projects/progbase3/web\_server/include/socket.h File Reference

```

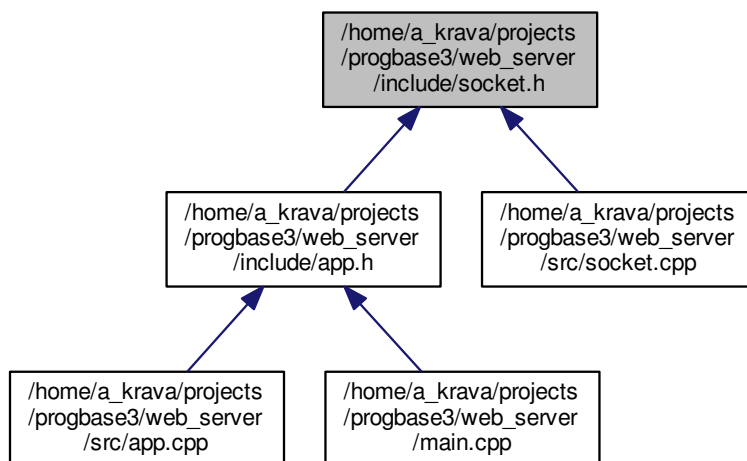

#include <string>
#include <init_params.h>
#include <sys/socket.h>

```

Include dependency graph for socket.h:

This graph shows which files directly or indirectly include this file:

## Classes

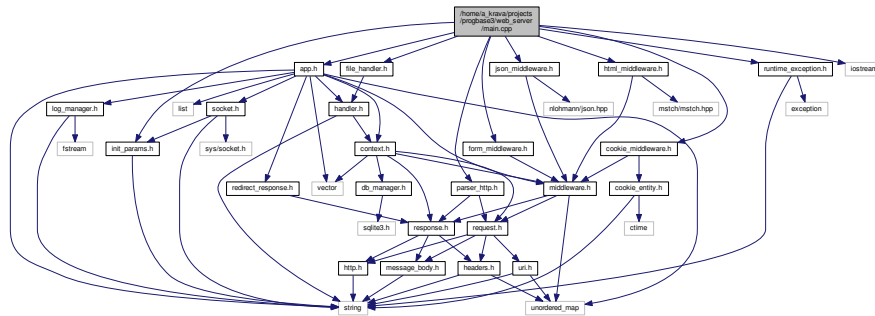

- class [Socket](#)

*wrapper functions to send/receive data via web-sockets*

```
#include <runtime_exception.h>
#include <parser_http.h>
Include dependency graph for main.cpp:
```

## Classes

- class [HandlerCommon](#)
- class [HandlerTemplate](#)
